

Main Objectives for Task Force II

Main Objective	Scientific Goal	Measures of success / deliverables
Integrated scenarios for long-pulse operation with PFC heat load control, efficient particle exhaust, and impurity screening	<ul style="list-style-type: none">• Control of divertor/baffle loads and actuation of heat load distribution• Studies on particle exhaust and optimization of plasma fueling schemes	<ul style="list-style-type: none">• Demonstration of safe divertor scenarios to avoid overloaded plasma-facing components• Determination of trim and/or control coil currents required to correct error fields• Demonstration of effective pumping, high divertor compression, and qualification of fueling actuators• Demonstration of long-pulse operation (1 GJ energy turnaround)
Development of long, stationary divertor detachment scenarios with and without impurity seeding	<ul style="list-style-type: none">• Creating conditions for detachment by tailoring edge plasma conditions and impurity seeding• Compatibility of stationary detachment with high-performance scenarios• Development of detachment scenarios with efficient exhaust	<ul style="list-style-type: none">• Demonstration of scenarios with long, stationary divertor detachment; in particular, for the high-mirror, high-iota and standard configurations• Characterize the conditions under which detachment is possible• Compatibility of detachment with high-performance scenarios• Achieve rapid transition to detachment

Main Objectives for Task Force II

Main Objective	Scientific Goal	Measures of success / deliverables
Exploration of scenarios compatible with carbon-free operation and tungsten PFCs	<ul style="list-style-type: none">• Migration (erosion, deposition) of tungsten-based materials and assessment of operation limits• Edge scenario development for metallic plasma-facing components	<ul style="list-style-type: none">• Definition of the operation limits associated with plasma-facing components containing tungsten materials• Characterize the scrape-off layer retention for tungsten impurities (eroded from baffle and heat shield)• Determination of erosion effects due to seeding impurities
Development of wall conditioning procedures	<ul style="list-style-type: none">• Optimization of glow discharge cleaning, boronization, and qualification of dedicated wall conditioning discharges with ECRH/ICRH	<ul style="list-style-type: none">• Condition walls to enable plasmas with high density gradients necessary for high performance

reference discharge for edge studies (attached conditions, with good diagnostic coverage)

-> progress evaluation, code validation
