The **scaling** used for the classical sheath model

$$h \ll \lambda_D \sim \sqrt{n_e} \ll \rho_i \sim \sqrt{T_i m_i} / B \ll L \sim T^2 / n_e$$

$$J_i = e n C_s \sin(\theta), \quad C_s = \sqrt{\frac{T_e + T_i}{m_i}}$$

J_TD_Ne_50.inp.d

$$Q_{div} = \gamma J_i T_e, \quad \gamma \sim 10$$

What happens when this scaling is not valid?

Main area of interest – divertor sheath: highest particle and power loads, strong erosion etc

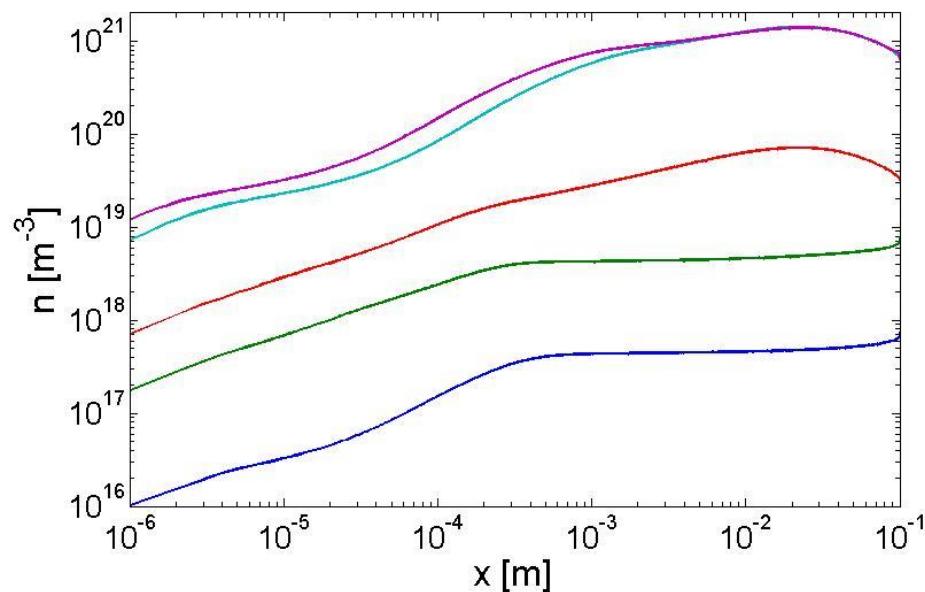

Modelling of divertor plasmas

Different densities, with and without neutrals and molecules.

Number of simulated cells: $3\text{-}10 \times 10^5$

$N_{\text{sim}} \sim N_{\text{real}}$

„Very high“ density = ITER relevant

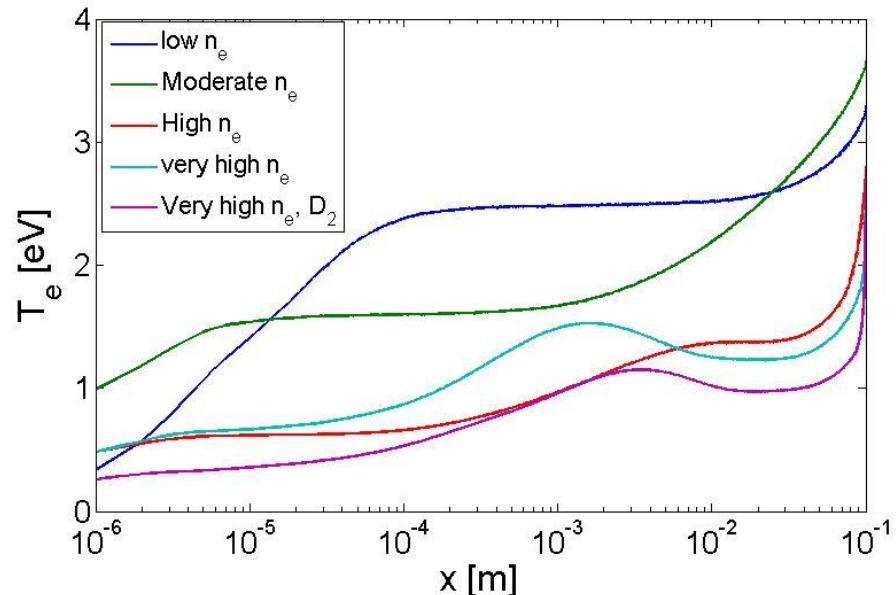

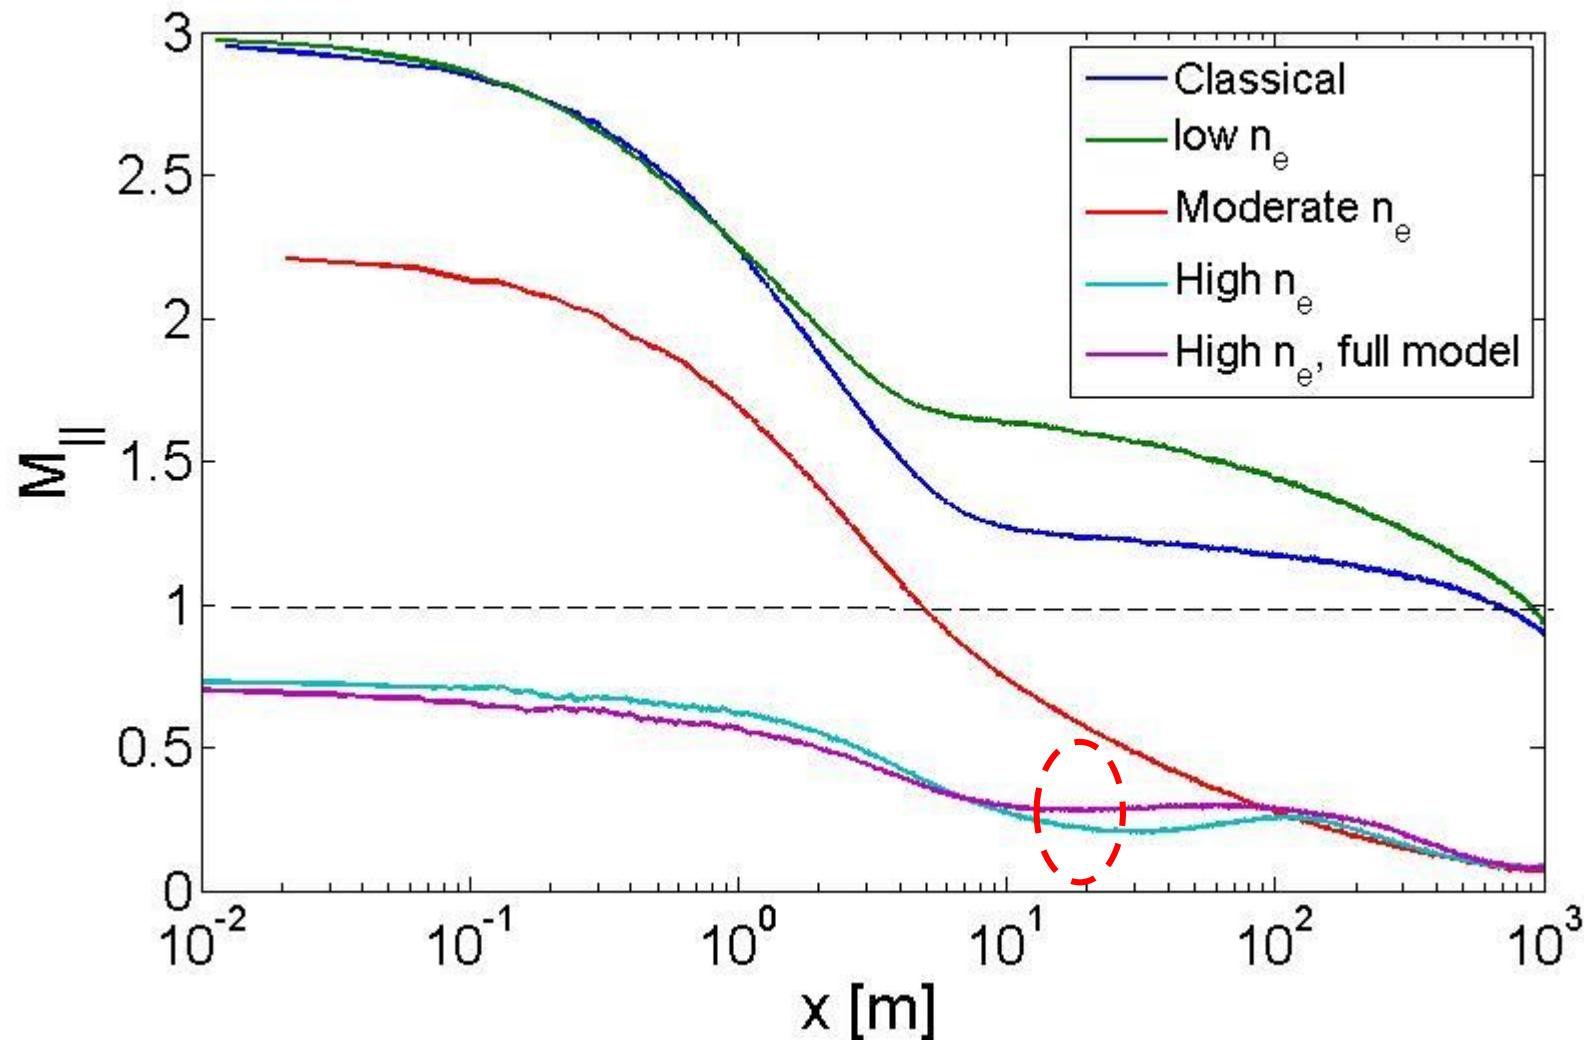

Estimation for DEMO

$$\frac{n_{\text{div}}^{\text{DEMO}}}{n_{\text{div}}^{\text{ITER}}} \sim \left(\frac{\nu^{\text{DEMO}}}{\nu^{\text{ITER}}} \right)^2 \left(\frac{1 - f_{\text{rad}}^{\text{ITER}}}{1 - f_{\text{rad}}^{\text{DEMO}}} \right)^2 \approx 10,$$

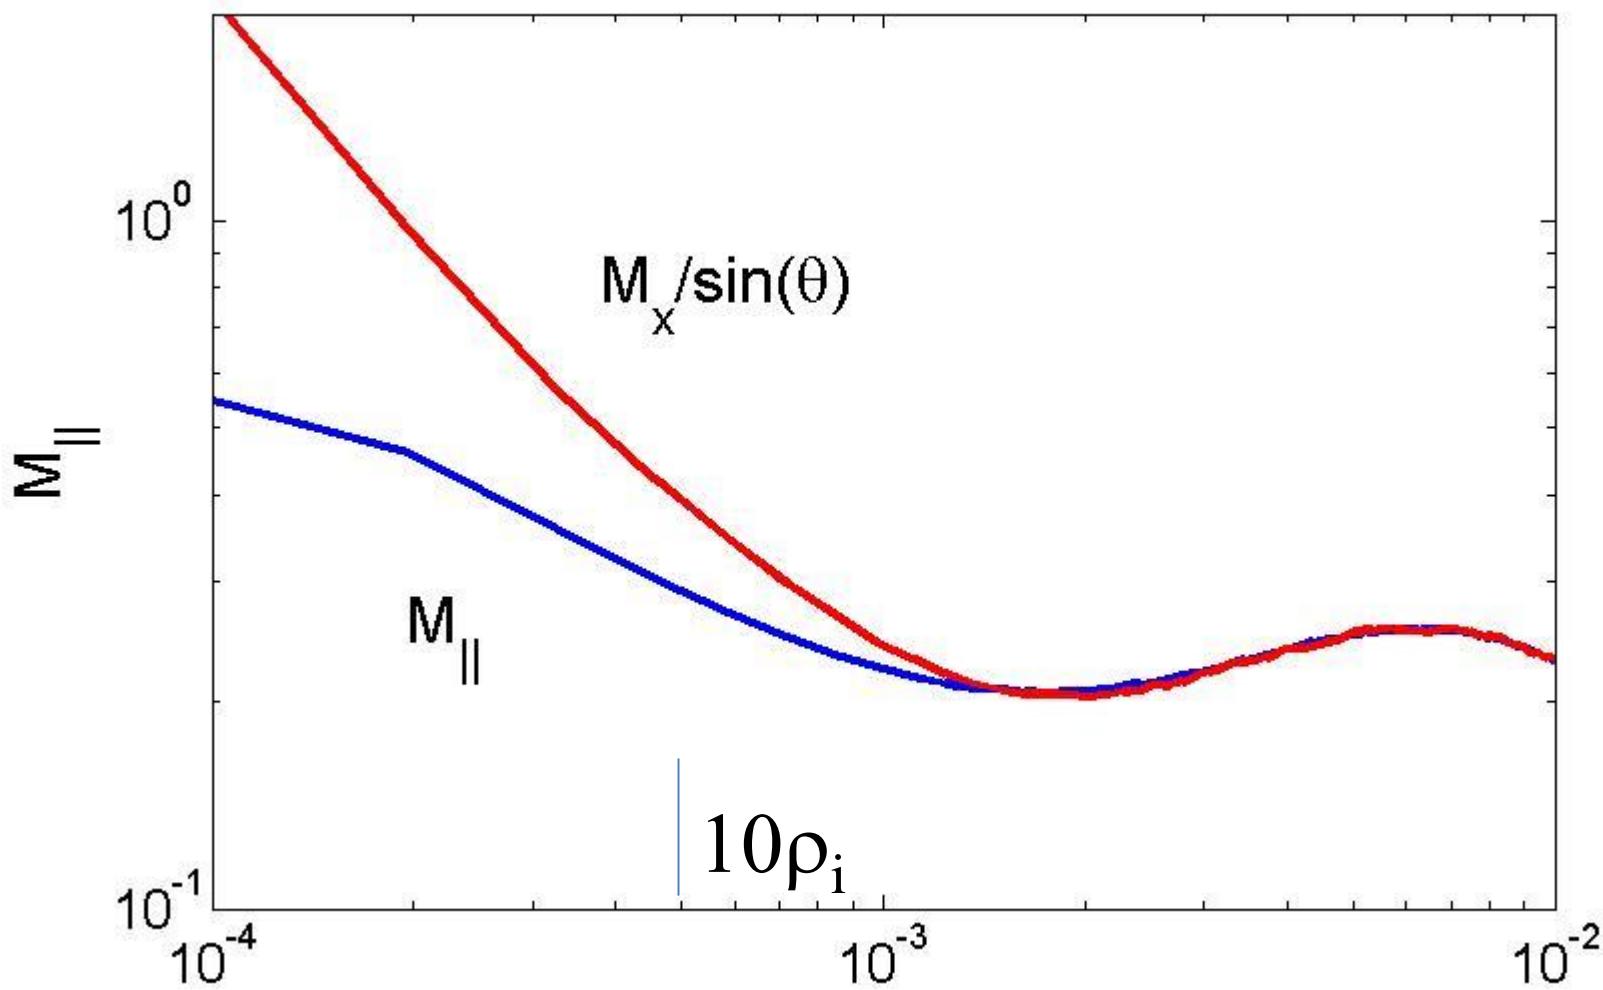

$$\frac{1 - f_{\text{rad}}^{\text{ITER}}}{1 - f_{\text{rad}}^{\text{DEMO}}} \approx \frac{1 - f_{\text{rad}}^{\text{DEMO}} R^{\text{ITER}} / R^{\text{DEMO}}}{1 - f_{\text{rad}}^{\text{DEMO}}} \approx 2.2$$

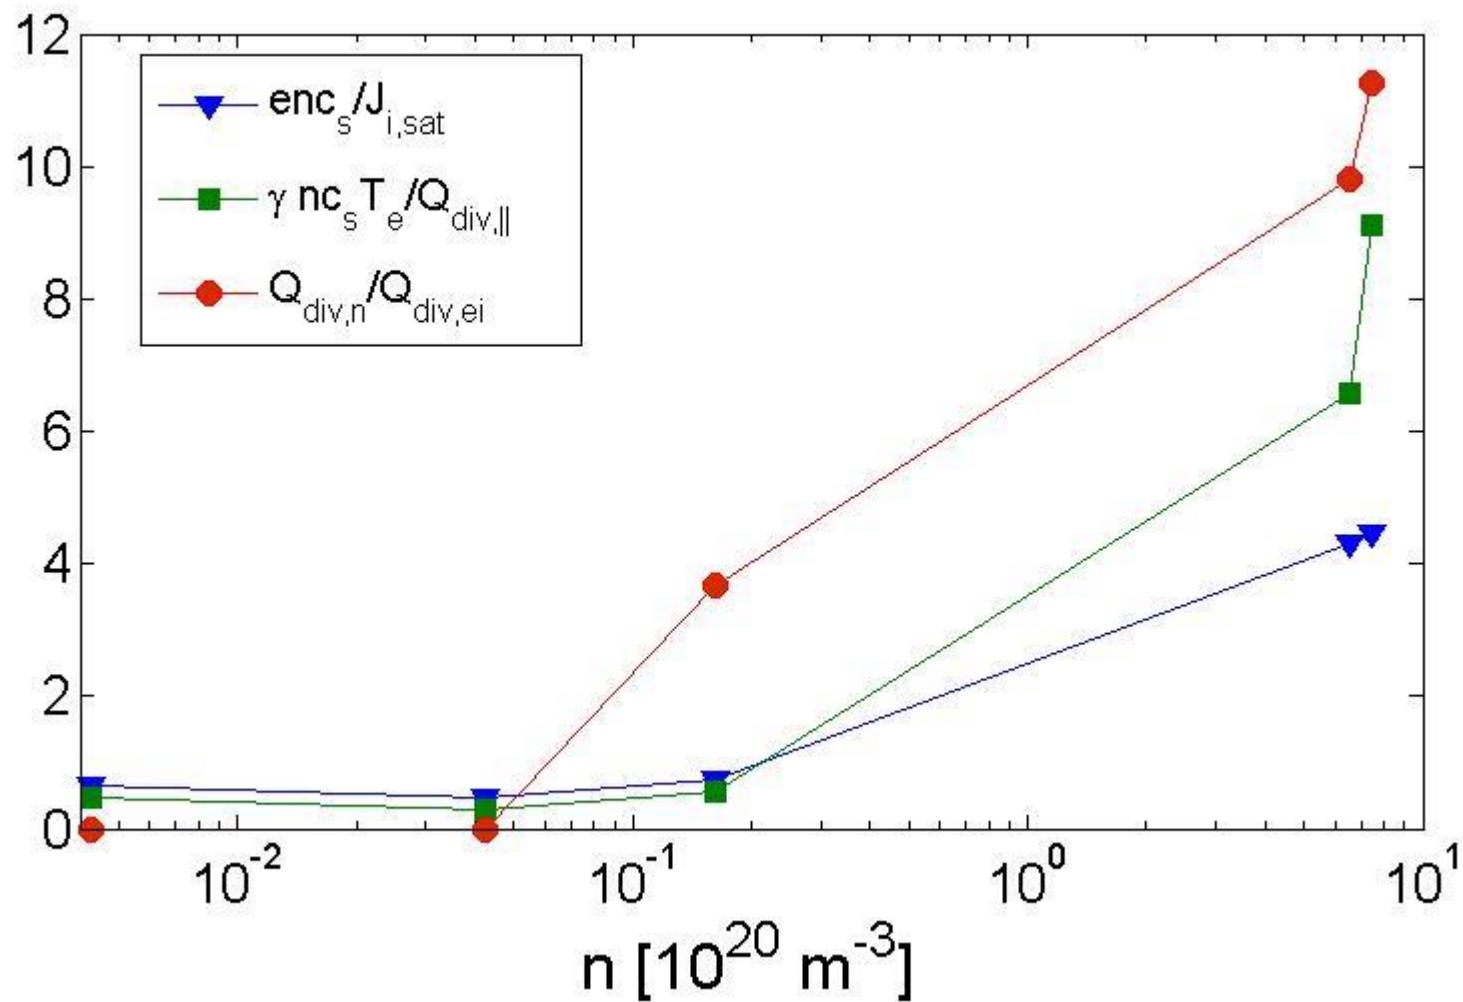

$$\frac{\nu^{\text{DEMO}}}{\nu^{\text{ITER}}} \approx \frac{R^{\text{DEMO}}}{R^{\text{ITER}}} \approx 1.45, \quad f_{\text{rad}}^{\text{DEMO}} \sim 0.8$$

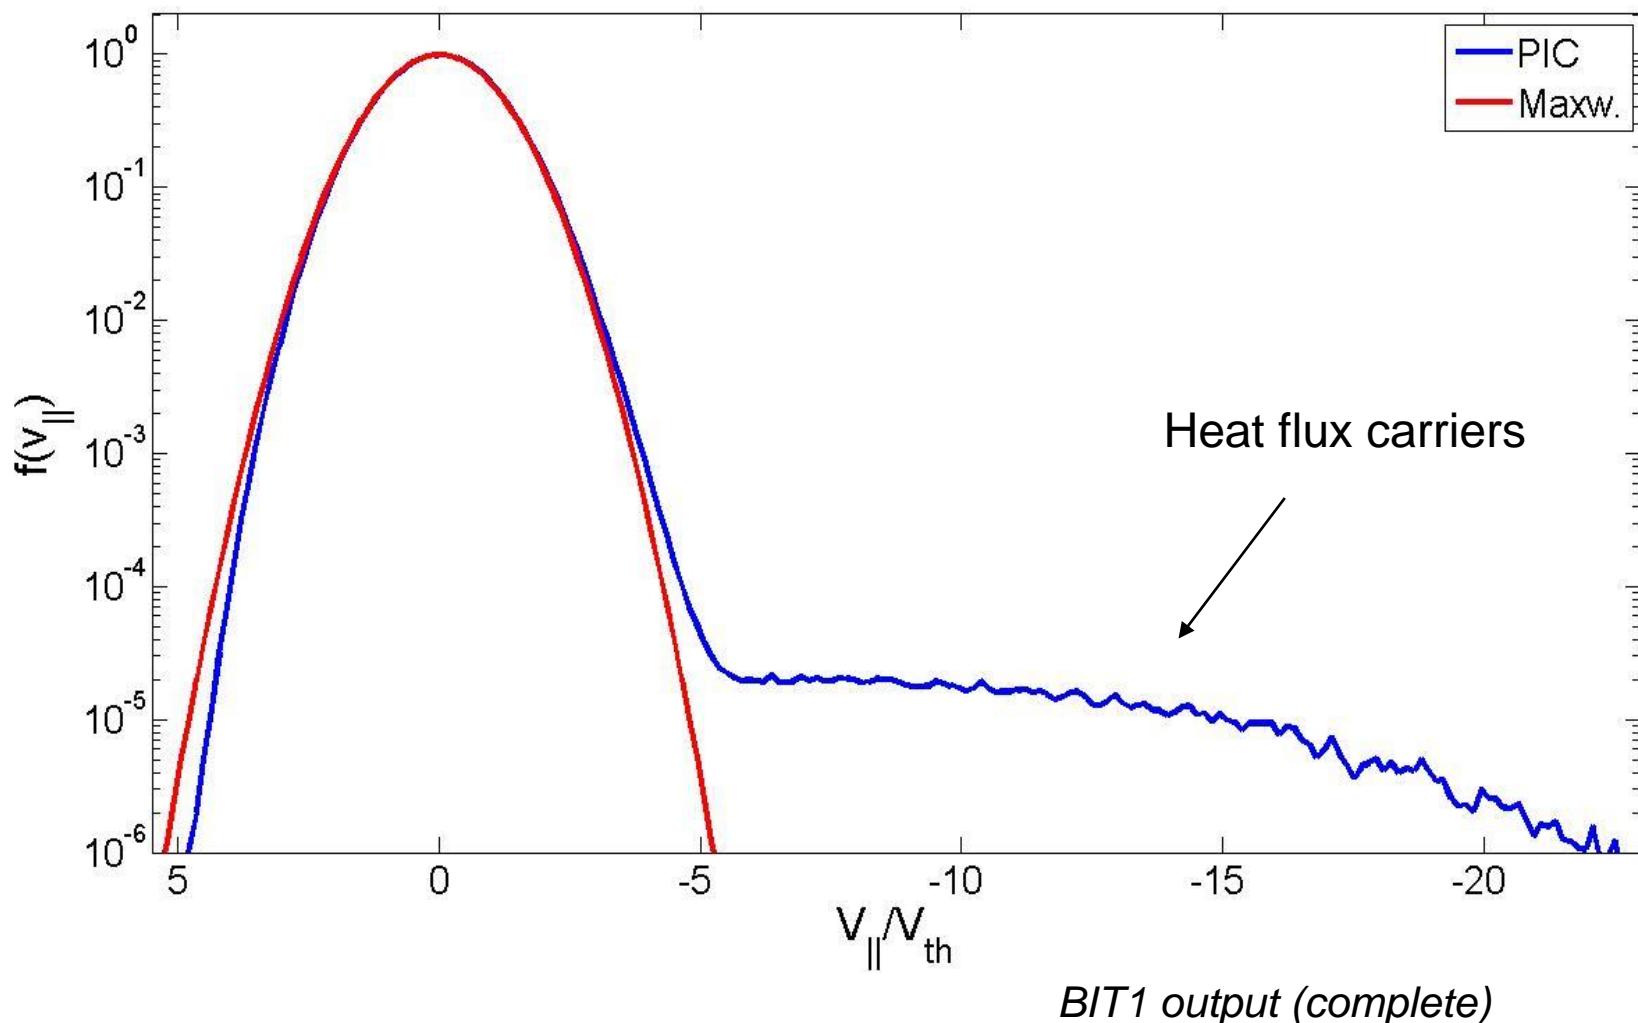

De-magnetization of plasma

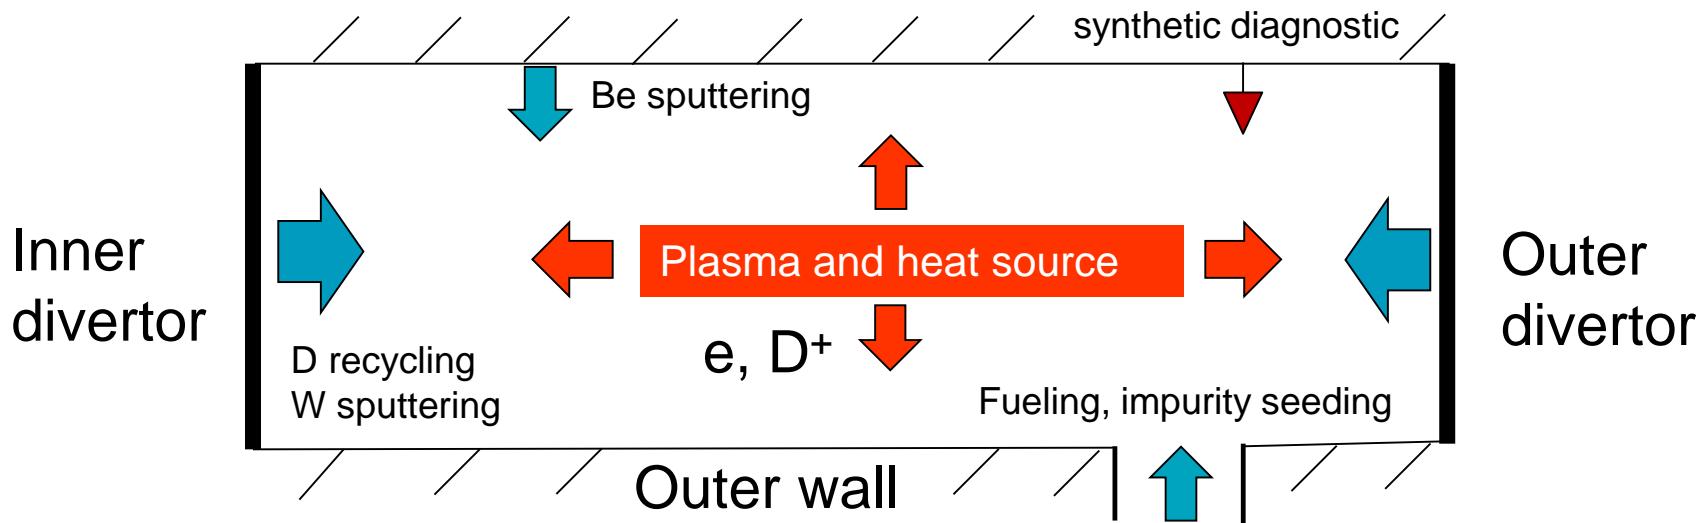

Electron VDF at the JET ID

- Complete modelling of DEMO-relevant divertor sheath ($n_e \sim 10^{22}$)
Implementation of Ar, photon-plasma interaction?
- Start multi-dimensional sheath modelling (BIT3)
- Other “requests” from TSVV-7 team?

Most of the activity will be performed In collaboration with J. Kovačič

Massively parallel (scaling $>4 \times 10^3$), **nonlinear interaction** between plasma, neutral and impurity particles, **linear PSI** (all together ~ 1000 processes)

Output of codes: all possible plasma profiles; energy, velocity and angular distribution functions at any positions and PFC; radiation spectrum and intensity.

Contributions to
TSVV-3, 4, 7

Synthetic diagnostic: plasma probes, spectroscopy
