

# Work Package Tokamak Exploitation Progress Summary and Status for 2021

**M. Wischmeier on behalf of the WP Tokamak Exploitation Task Force Leaders:  
E. Joffrin, A. Hakola, B. Labit, N. Vianello, E. Tsitrone**

This work has been carried out within the framework of the EUROfusion Consortium and has received funding from the Euratom research and training programme 2014-2018 and 2019-2020 under grant agreement No 633053. The views and opinions expressed herein do not necessarily reflect those of the European Commission.

# Exploitation of EUROfusion Tokamaks in 2021

- ❑ Programme execution on 3 devices in 2021: ASDEX Upgrade, MAST-U, TCV with WEST (C6) postponed to 2022
- ❑ Proud of having managed 3 operating devices, with 2 simultaneously operating most of the time despite COVID-19 measures, lack of travel, remote meetings the 2021 campaign was successful
- ❑ For most scientific objectives complimentary effort between internal and WP TE program

| Machine | 2021        |     |                    |     |                                  |     |            |             |             |             |     |     |
|---------|-------------|-----|--------------------|-----|----------------------------------|-----|------------|-------------|-------------|-------------|-----|-----|

WPTE WEST  
Not before 03/2022

as of 17<sup>th</sup> June 2021

- ❑ JET to be integrated end of 2021 with a pre-defined programme (C40B)

# List of Research Topics in Mission 1

## Collaboration with WP r10

**Mission 1-1:** Demonstrate and qualify MHD stable high performance operation with metallic plasma facing components for ITER and DEMO

|     |   |
|-----|---|
| RT1 | IBL scenarios towards low detachment and low collisionality (14)      |
| RT2 | H-mode entry and pedestal dependence with impurities and isotopes (9) |
| RT3 | RF-assisted breakdown and current ramp-up optimization (8)            |
| RT4 | Disruption avoidance development for ITER and DEMO (10)               |
| RT5 | Run-away electron generation and mitigation (11)                      |
| RT6 | ELM mitigation and suppression in ITER/DEMO relevant condition (4)    |
| RT7 | Negative triangularity scenarios as an alternative for DEMO(4)        |
| RT8 | I-mode and QH-mode studies assessment in view of DEMO(7)              |
| RT9 | Extension of EDA and QCE performance towards DEMO (7)                 |

**Mission 1-2:** Improve physics description (experiments, theory / simulation) of energetics particles including their non-linear interplay with thermal plasmas in order to control burning plasmas in ITER and DEMO.

|      |  |
|------|--|
| RT10 | Fast-ion physics with dominant ICRF heating (10)             |
| RT11 | Impact of MHD activity on fast ion losses and transport (14) |

**Mission 1-3:** Develop integrated scenarios with controllers for long pulse, ultimately steady state, operation for ITER and DEMO.

|      |  |
|------|--|
| RT12 | Development of the steady state scenario (7) |
|------|--|

# List of Research Topics in Mission 2

**Mission 2-1:** Detachment control for ITER, DEMO baseline and HELIAS operation.

RT13 X-point radiation and control (8)

RT14 Physics of plasma detachment / impurity mix/ heat load patterns (16)

RT15 Extrapolation of SOL transport to ITER and DEMO (14)

**Mission 2-2:** Prepare efficient Plasma Facing Components (PFC) operation for ITER, DEMO and HELIAS.

RT16 PFC damage evolution under tokamak conditions (7)

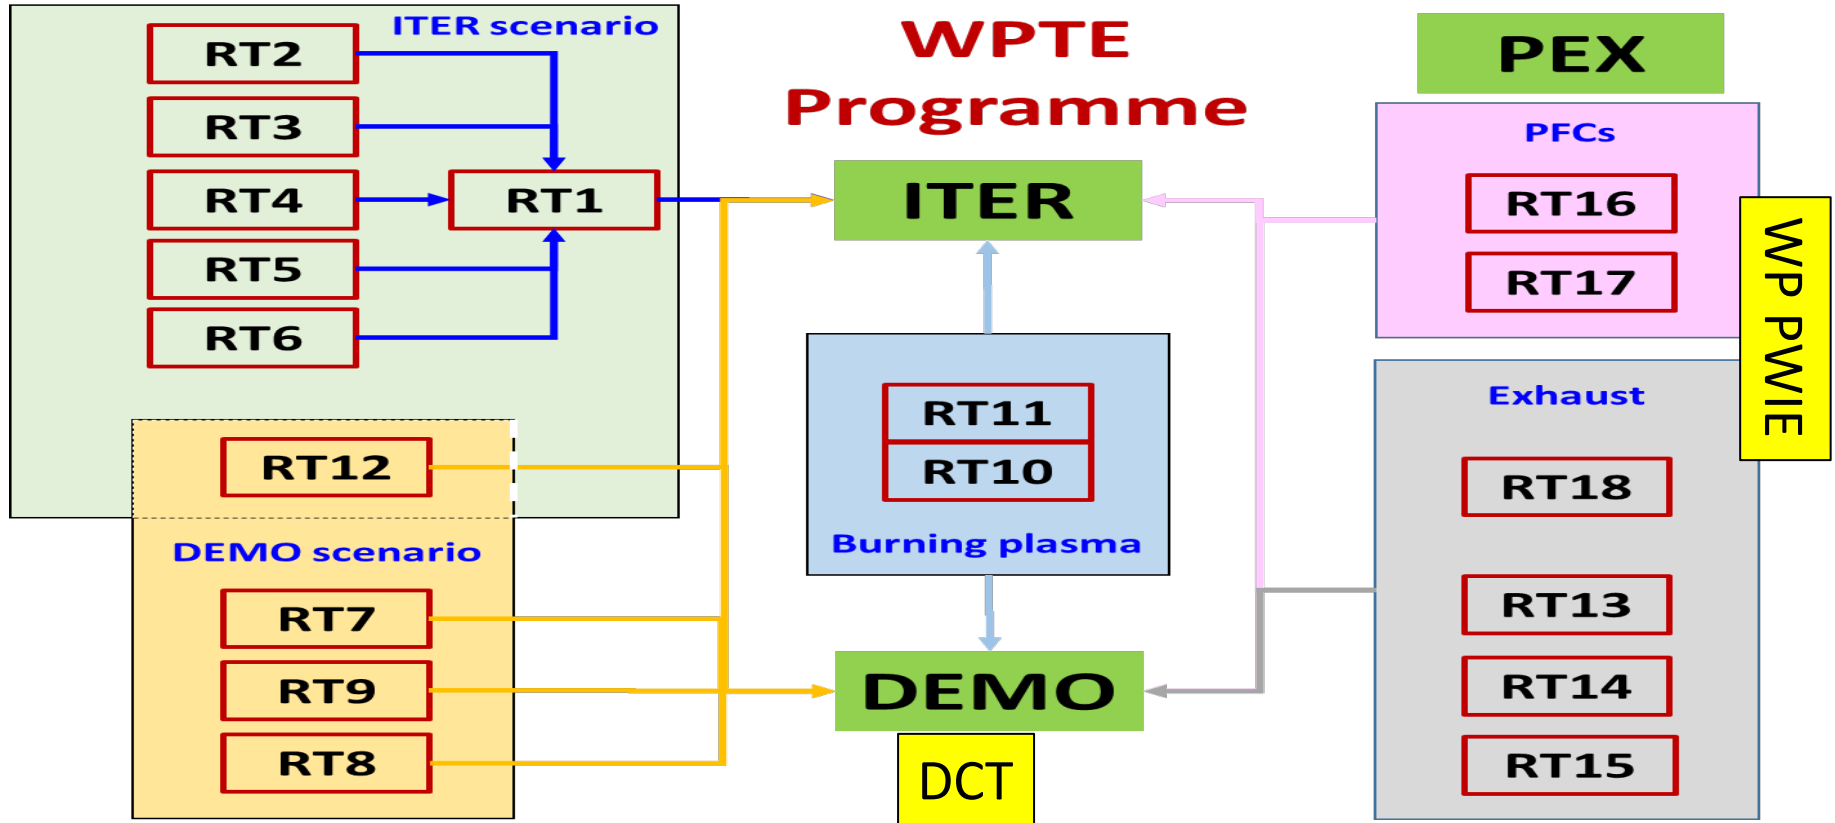

RT17 Material migration and fuel retention mechanisms in tokamaks (10)

## Collaboration with WP WPIE

**Mission 2-3:** Investigate alternative innovative divertor geometries for DEMO.

RT18 Alternative divertor configurations (12)

# Structure of WP TE

# Pulse balance on devices as of 13<sup>th</sup> Sep 2021

| Device | Total pulse budget | Contingency | Allocated Mission 1 | Allocated Mission 2 | Executed Mission 1 | Executed Mission 2 | percentage of total budget |
|--------|--------------------|-------------|---------------------|---------------------|--------------------|--------------------|----------------------------|
| AUG    | 387                | 67          | 219                 | 101                 | 260                | 116                | 97.2 %                     |
| MAST-U | 360                | 61          | 165                 | 134                 | 72                 | 101                | 48 %                       |
| TCV    | 806                | 161         | 339                 | 306                 | 138                | 170                | 38.2 %                     |

- WEST C6 campaign moved to April/May 2022 (restart March 2022)
- AUG for Nov/Dec not yet allocated
- Mast-U foreseen to operate until end October – risk of not executing entire WP TE program

# Research Topic Status Evaluation Criteria

| Level                       | Criteria   |
|-----------------------------|--|
| Emerging                    | Little or no understanding yet on WP TE devices  |
| Exploratory                 | Physical process is assessed on WP TE devices, transposing to ITER or DEMO is uncertain  |
| Judgemental                 | Controlling physical processes has been assessed on WP TE devices, but extrapolation to ITER/DEMO requires scalable parameters and further investigation |
| Mature - needs underpinning | Good understanding of controlling physical processes on WP TE devices, but major uncertainty in view of transposing ITER/DEMO                            |
| Mature - needs support      | A good understanding has been achieved on WP TE devices, further research exploring ITER or DEMO relevant parameters                                     |
| Established                 | Understanding is well developed and can be applied to ITER or DEMO   |

- Further refinement of Ansatz may be needed; e.g. some distinction between ITER & DEMO
- WP TE deliverables given here = multi year programme
- N.B.: Ds marked as scientific objective for 2021 for which significant progress in 2021 targeted

# RT01: IBL scenario towards detachment and low collisionality

|    |  | 21 | Status                | Achievements  |
|----|--|----|-----------------------|---|
| D1 | Assess the core transport properties of IBL scenarios with dominant electron heating (low $\nu^*$ , low rotation) and He seeding | X  | Judgemental           | <ul style="list-style-type: none"> <li>❖ AUG: exploration of low <math>\nu^*</math> at <math>q_{95}=3</math> for different plasma currents with RMPs</li> <li>❖ TCV: improve shape closer to ITER one: <math>\Delta_{top} = \Delta_{bottom} = 0.5</math></li> </ul> |
| D2 | Improve the understanding of MHD stability and impurity accumulation during the transient phases of the H-mode.                  |    | Judgemental           | <ul style="list-style-type: none"> <li>❖ AUG: H-mode entry: EDA with strong fuelling and reduced power.</li> <li>❖ AUG: H-mode exit: stable ramp-down w/o <math>\kappa</math> change</li> </ul>   |
| D3 | Optimize error field correction in MAST-U by using knowledge from other EU tokamaks (JET, AUG, COMPASS)                          | X  | Mature - underpinning | <ul style="list-style-type: none"> <li>❖ MAST-U: Compass scan at 0.4MA</li> </ul>   |
| D4 | Extend the cross machine comparison of the dimensionless parameter dependence of momentum and particle transport                 |    | Exploratory           | <ul style="list-style-type: none"> <li>❖ Session planned on TCV with 2nd NBI</li> </ul>   |
| D5 | Characterize the edge conditions with pellet fuelling and the detachment requirements for the IBL scenario                       |    | Exploratory           | <ul style="list-style-type: none"> <li>❖ TCV: N<sub>2</sub> seeding in IBL. L-H transition at high density. <math>f_{G} \sim 1</math> achieved</li> </ul>   |

# RT02: H-mode entry and pedestal dependence with impurities and isotopes

|    |   | 21 | Status      | Achievements   |
|----|---|----|-------------|--|
| D1 | Quantify heat and particle transport across the pedestal and the SOL in low $\nu$   | X  | Exploratory | <ul style="list-style-type: none"> <li>❖ AUG: Reached low <math>\nu^*</math> and</li> <li>❖ TCV:n on-stationary low <math>\nu^*</math> plasmas on</li> <li>❖ Good advancement in scenario development</li> </ul> |
| D2 | Isotope/mixed species dependence of the pedestal and SOL, including the LH transition   |    | Exploratory | <ul style="list-style-type: none"> <li>❖ Good shape scan in H and D at different fuelling levels</li> </ul>  |
| D3 | Assess pedestal performance in ITER/DEMO relevant scenarios (dominant electron heating/low torque/seeded impurities/low $\nu^*$ ) |    | Judgemental | <ul style="list-style-type: none"> <li>❖ Pretty large scan available between AUG and TCV on density, delta, power.</li> </ul>  |
| D4 | Improve predictive capabilities of pedestal performance with coupled SOL/pedestal integrated modelling                            |    | Exploratory | <ul style="list-style-type: none"> <li>❖ Not started but this is the key point</li> </ul>  |
| D5 | Estimate the impact of radiative impurities on the H-mode access  |    | Emerging    | <ul style="list-style-type: none"> <li>❖ Not started as low priority for 2021</li> </ul>   |

## RT03: RF-assisted breakdown and current ramp-up optimization

|    |   | 21 | Status      | Achievements   |
|----|---|----|-------------|--|
| D1 | Develop reliable ECRH and/or ICRH methods for RF assisted breakdown and produce prediction for ITER to determine the required RF power. | X  | Judgemental | <ul style="list-style-type: none"><li>❖ Burn through experiment in AUG and comparison with the BKD0 model</li><li>❖ Validation of the X3 ECRH scheme for ITER</li><li>❖ Close to achieve next highest status (bridge to ICRF experiments on JET)</li></ul> |
| D2 | Optimize the ramp-up path (wrt impurity accumulation, MHD, flux saving) in metallic devices.  |    | Exploratory | <ul style="list-style-type: none"><li>❖ Modelling on-going</li></ul>   |
| D3 | Produce an integrated simulation of the breakdown and ramp-up phase for the first ITER plasmas  |    | Exploratory | <ul style="list-style-type: none"><li>❖ Modelling on-going with CREATE and RAPTOR together with WPriO</li></ul>  |

# RT04: Disruption avoidance development for ITER and DEMO

|    |   | 21 | Status                      | Achievements  |
|----|---|----|-----------------------------|---|
| D1 | Advance control frameworks on WPTE devices for integrated disruption avoidance: state observers, actuator sharing, RT event detectors       | X  | Mature – needs underpinning | ❖ Similar method developed on AUG and TCV           |
| D2 | Improve predictive understanding of specific disruption paths and their avoidance. Focus on H-mode density limit (HDL) disruptions and NTMs |    | Judgemental                 | ❖ Avoidance scheme in development but not yet ready |
| D3 | Implement and study automated methods for discharge recovery or soft-stop   |    | Exploratory                 |   |

# RT05: Run-way generation and mitigation

|    |  | 21 | Status      | Achievements   |
|----|--|----|-------------|--|
| D1 | Determine the conditions including density increase by pellets for the damping physics mechanisms generating run-away electrons after the thermal quench | X  | Judgemental | <ul style="list-style-type: none"> <li>❖ Exploration of the hot-tail mechanism in AUG at high <math>T_e</math></li> <li>❖ D2/H2 flushing experiment.</li> </ul>  |
| D2 | Determine the physics dependencies including heating, shape, and density for generating run-away electrons in the plasma start-up phase                  |    | Exploratory | <ul style="list-style-type: none"> <li>❖ No new data produced yet</li> </ul>   |
| D3 | Develop and exploit measurement tools including (e.g., energy spectrum, density) for characterizing run-away electron beams                              | X  | Exploratory | <ul style="list-style-type: none"> <li>❖ REIS and RF antenna in preparation for experiments this year in TCV. GEM and REIS also planned for WEST 2022</li> </ul> |
| D4 | Test run-away electron mitigation with alternative methods (e.g., fueling pellets, MHD EC waves)   |    | Emerging    |  |

# RT06: ELM mitigation and suppression in ITER/DEMO relevant condition

|    |   | 21 | Status      | Achievements  |
|----|---|----|-------------|---|
| D1 | Establish RMP ELM suppression on MAST-U and compare to AUG  | X  | Emerging    | ❖ First experiments initiated on MAST-U   |
| D2 | Document ELM suppression in view of ITER PFPO operations in H   | X  | Exploratory | ❖ Found limit of 38% hydrogen concentration for ELM suppression   |
| D3 | Determine access window to RMP ELM suppression and its compatibility with low torque, dominant electron heating, and radiative divertor for ITER FPO and DEMO                       |    | Judgemental | <ul style="list-style-type: none"> <li>❖ ELM suppression is most consistently obtained with sufficient NBI heating</li> <li>❖ Maximum pedestal density during pellet injection can be maintained for ELM suppression</li> </ul> |
| D4 | Quantify the influence of 3D magnetic perturbations (2021) and transport of impurities (2022) on kinetic modelling of RMP ELM suppression for extrapolations towards ITER and DEMO. | X  | Judgemental | ❖ Kinetic modelling can provide explanations on ELM suppression and derived field penetration condition in line with experimental observations  |
| D5 | Determine effectiveness of ECRH / ECCD-driven ELM mitigation for DEMO   |    | Emerging    | ❖ Late 2021 on TCv  |

|    |  | 21 | Status      | Achievements   |
|----|--|----|-------------|--|
| D1 | Advanced MHD equilibrium and stability analysis of TCV and AUG plasmas   |    | Exploratory | ❖ Activity started   |
| D2 | Develop similar scenarios in TCV and AUG to support iDTT design  |    | Emerging    | ❖ Not touched  |
| D3 | Investigate power exhaust and detachment with simulations (2021) and in experiments in AUG and TCV (2022)  | X  | Emerging    | ❖ Modelling activity started on AUG; about to start on TCV |
| D4 | Provide answers on the plasma core confinement properties (density limit, plasma current limit, ...) to the EUROfusion Ad-hoc Group ("Proof of principle Phase") |    | Emerging    | ❖ Not touched  |

# RT08: QH-mode and I-mode assessment in view of DEMO

|    |  | 21 | Status      | Achievements  |
|----|--|----|-------------|---|
| D1 | Develop I-mode and QH-mode and determine existence space   | X  | Emerging    | <ul style="list-style-type: none"> <li>❖ AUG: looking for I-mode in fwd-Bt: promising results with improved confinement wrt L-mode</li> <li>❖ TCV: 1 session done so far focusing on QH-mode: scenario development – no clear sign of QH/EHO phase</li> </ul> |
| D2 | Extend cross-machine scaling of PL-I threshold   |    | Emerging    | <ul style="list-style-type: none"> <li>❖ Exploration of I-mode in fwd-Bt/Ip</li> </ul>  |
| D3 | Compatibility of QH-mode and I-mode with DEMO constraints (including dominant electron heating, low torque, high $n_{e,sep}$ , dissipative divertor) |    | Emerging    | <ul style="list-style-type: none"> <li>❖ Not addressed; Rev-Bt/Ip campaign needed on AUG</li> </ul>   |
| D4 | Access and sustainment of QH-mode with a metallic wall   |    | Exploratory | <ul style="list-style-type: none"> <li>❖ QH-mode phase extended up to 500 ms</li> </ul>   |
| D5 | Quantify heat loads for I-mode and QH-mode and compare with existing scaling(s)  |    | Exploratory | <ul style="list-style-type: none"> <li>❖ Data collected (most likely), but missing competencies for analysis</li> </ul>   |

|    |   | 21 | Status      | Achievements   |
|----|---|----|-------------|--|
| D1 | Expand the cross-machine comparison for the QCE and the EDA regimes                               | X  | Exploratory | <ul style="list-style-type: none"> <li>❖ AUG: good progress</li> <li>❖ TCV: QCE with comparison between baffles and non-baffles</li> <li>❖ MAST-U: QCE re-established</li> </ul> |
| D2 | Extend the parameter range of both regimes towards low $\nu^*$ and low $q_{95}$                   | X  | Judgemental | <ul style="list-style-type: none"> <li>❖ AUG: low-q likely possible</li> </ul>   |
| D3 | Assess the compatibility of both regimes with various radiative conditions (ITER/DEMO conditions) |    | Exploratory | <ul style="list-style-type: none"> <li>❖ AUG: QCE partially detached, EDA compatible with Ar and N seeding.</li> <li>❖ TCV: QCE executed within RT14</li> </ul>                  |
| D4 | Identify the key parameters for a scaling of the heat loads in both regimes                       |    | Emerging    | <ul style="list-style-type: none"> <li>❖ AUG: QCE data acquired</li> </ul>   |
| D5 | Identify in experiments and with modelling the instabilities regulating the pedestal transport    |    | Exploratory | <ul style="list-style-type: none"> <li>❖ AUG: Some good data acquired.</li> </ul>  |
| D6 | Characterise QCE and EDA regimes for hydrogen and helium plasmas                                  |    | Exploratory | <ul style="list-style-type: none"> <li>❖ AUG: Promising hydrogen discharges performed</li> </ul>   |

# RT10: Fast-ion physics with dominant ICRF heating

|    |   | 21 | Status                      | Achievements  |
|----|---|----|-----------------------------|---|
| D1 | Determine fast-ion characteristics, plasma performance, and transport in ICRF-heated scenarios in multiple machines in preparation for ITER PFPO and FPO operations | X  | Mature – needs underpinning | ❖ 3-ion scenario on AUG ( $^3\text{He}$ or $^4\text{He}$ ) with good plasma heating in ITER-relevant conditions demonstrated, comparison with and without ICRF and ECRF   |
| D2 | Provide essential diagnostics information for the characterization of confined and lost fast ions in plasmas relevant for ITER PFPO and FPO                         |    | Mature – needs underpinning | <ul style="list-style-type: none"> <li>❖ Good data using CXRS and FILD on AUG, diagnostics working, <math>^3\text{He}</math> and <math>^4\text{He}</math> lines can be separated</li> <li>❖ AE-induced FI losses can be mitigated by D-NBI heating spectrum</li> <li>❖ NBI-driven AE modes during ICRF heating characterized and frequency decrease when density increases</li> </ul> |
| D3 | Quantify Ti heating and core turbulence stabilization by ICRF-generated fast ions in view of ITER and DEMO  |    | Exploratory                 | ❖ Demonstrated ICRF heating generates fast-ion populations, predicted Ti stiffening demonstrated & dependence on H/D  |
| D4 | Integrate the available heating, fast-ion and transport modelling tools for interpretation of experimental results in view of ITER and DEMO.                        |    | Emerging                    | ❖ Later years   |

# RT11: Impact of MHD perturbations on fast ion losses

|    |  | 21 | Status      | Achievements   |
|----|--|----|-------------|--|
| D1 | Assessment of fast-ion transport and losses induced by MHD perturbations such as ELMs, NTMs, Sawtooth, Alfvén Eigenmodes and other relevant continuum fast-ion driven fluctuations | X  | Exploratory | <ul style="list-style-type: none"> <li>❖ ELM induced FI losses: q95 scan</li> <li>❖ AE control with ECCD</li> <li>❖ Fast ion slowing down at high ne: promising results from CTS diagnostic</li> <li>❖ FI transport by NTM: data collected.</li> </ul> |
| D2 | Identification of control actuators to minimize AE-induced fast-ion losses in view of ITER and DEMO  |    | Exploratory | <ul style="list-style-type: none"> <li>❖ Not touched since not a priority for 2021</li> </ul>  |
| D3 | Optimization of fast-ion confinement in tokamaks with RMPs   |    | Exploratory | <ul style="list-style-type: none"> <li>❖ AUG: FILD measurements with 3D fields</li> <li>❖ AUG: ELM suppression sustained with rigid rotation</li> </ul>  |

# RT12: Development of the steady state scenario

|    |  | 21 | Status   | Achievements   |
|----|--|----|----------|--|
| D1 | Develop an intrinsically steady state solution at high betaN (>3) in terms of q/pressure profile and stability. Compare it with other existing solutions in view of its application to JT-60SA and DEMO. | X  | Emerging |  |
| D2 | Quantify the impact of Ti/Te and rotation on the core performance with dominant electron heating.  | X  | Emerging | ❖ Possible revision of scientific objective in view of RT01 & RT02 |
| D3 | Identify, define and test the required control schemes for robust operation  |    | Emerging |  |
| D4 | Compatibility of long pulse (> several resistive time) with the boundary interface with high-performance core.   |    | Emerging |  |
| D5 | Characterize the ExB, magnetic shear, turbulence conditions in the achieved solution   |    | Emerging |  |

# RT12: Development of the steady state scenario

|    |  | 21 | Status   | As                              |
|----|--|----|----------|---------------------------------|
| D1 | Develop an intrinsically steady state solution at high betaN (>3) in terms of q/pressure profile and stability. Compare it with other existing solutions in view of its application to JT-60SA and DEMO. | x  | Emerging |                                 |
| D2 | Quantify the impact of Ti/Te and rotation on the core performance with dominant electron heating.  |    |          | Scientific objective in view of |
| D3 | Identify, describe and quantify the impact of the surface conditions on the steady state scenario.   |    |          |                                 |
| D4 | Characterize the surface conditions in the achieved solution   |    | Emerging |                                 |
| D5 | Characterize the ExB, magnetic shear, turbulence conditions in the achieved solution   |    | Emerging |                                 |

It is expected that RT12 can make faster progress towards judgemental once experiments take off on all relevant devices, as it is expected that for D1-D3 sufficient physics knowledge exists – but has not been applied under conditions required for RT12

# RT13: X-point radiation and control

|    |  | 21 | Status      | Achievements   |
|----|--|----|-------------|--|
| D1 | Determine existence diagram and improve understanding for X-point radiation on all WP TE devices in comparable scenarios in H-mode       |    | Judgemental | <ul style="list-style-type: none"> <li>❖ First exploration on MAST-U</li> <li>❖ XPR characterized</li> <li>❖ LSN well established on AUG</li> <li>❖ Interpretative modelling ongoing</li> <li>❖ Wide range of data</li> </ul>  |
| D2 | Identify the stability of X-point radiator using available analytical models and numerical methods in conjunction with experimental data | X  | Exploratory | <ul style="list-style-type: none"> <li>❖ Modelling ongoing for establishing numerical XPR regimes as basis for sensitivity studies</li> <li>❖ Requires validation of combination/integration of codes: e.g. SOLPS-ITER, SOLEDGE-EIRENE type of codes &amp; Pedestal/Core codes (EUROPED, ETS, ASTRA, JETTO/JINTRAC)</li> </ul> |
| D3 | Demonstrate reliable (multi-sensor) detachment control schemes in multiple devices   |    | Exploratory | <ul style="list-style-type: none"> <li>❖ Partially applied on AUG, MANTIS on TCV, MAST-U needs to reach D1 first</li> </ul>  |
| D4 | Demonstrate exhaust-compatible ramp-up/-down into detachment (including L-H transition) for at least one device                          |    | Emerging    | <ul style="list-style-type: none"> <li>❖ No activities inside TE yet</li> </ul>  |

# RT14: Physics of plasma detachment / impurity mix/ heat load patterns

|    |   | 21 | Status                      | Achievements   |
|----|---|----|-----------------------------|--|
| D1 | Characterize detachment access and core plasma performance in scenarios using different gas valve locations, enrichment and compression, impurity mixtures, and field direction   |    | Mature – needs underpinning | Impurity seeding scan performed in AUG (Ar/N2) and TCV   |
| D2 | Explore the effect of divertor pressure on detachment and plasma core performance through changes in pumping speed and divertor closure   | X  | Judgemental                 | Impact of divertor closure investigated in TCV (old vs new baffles) and MAST-U (first experiments) |
| D3 | Assess whether the parameter dependences related to detachment scale the same between (reduced) SOL models and experiment and determine the impact of divertor geometries (e.g. baffled vs. non-baffled and compact vs. conventional) on these trends                                     |    | Judgemental                 | AUG and TCV simulations started  |
| D4 | Quantify the degree of ELM buffering achievable by impurity seeding, investigating the dependences on relevant machine parameters (e.g. Ip and divertor geometry) and the different measurements that may scale with the energy deposited by the ELM (e.g. floating potential or H-alpha) |    | Exploratory                 | ELM buffering assessed in AUG and TCV seeding experiments.   |
| D5 | Measure divertor heat loads and assess power/energy balance in attached & detached divertor operation   | X  | Emerging                    | Not addressed yet  |

# RT15: Extrapolation of SOL transport to ITER and DEMO

|    |   | 21 | Status      | Achievements  |
|----|---|----|-------------|---|
| D1 | Determine changes of the upstream profiles (including electric field and density, eg density shoulder) under different SOL and divertor conditions  | X  | Judgemental | <ul style="list-style-type: none"> <li>❖ TCV: H-mode investigation on main chamber neutral dependence for shoulder formation, <math>E_r</math> only in L-mode → extension to H-mode required</li> <li>❖ AUG: Geometry scan for shoulder formation</li> <li>❖ AUG: <math>E_r</math> investigation w.r.t. target conditions and collisionality in L-Mode</li> </ul> |
| D2 | Disentangle the role of ion/electron channel transport in the near and far SOL  | X  | Judgemental | <ul style="list-style-type: none"> <li>❖ Good database on AUG and TCV.</li> </ul>   |
| D3 | Quantify particle and heat load in the near and far SOL under different confinement regime (including no-ELM regimes) and divertor recycling state.   |    | Emerging    | <ul style="list-style-type: none"> <li>❖ None reported; RFA in L-mode → more effort required</li> <li>❖ Data base existing, missing data analysis and modelling</li> </ul>  |
| D4 | Document associated turbulence properties near the X-point and in divertor region   |    | Emerging    | <ul style="list-style-type: none"> <li>❖ None reported – unclear if required data acquired</li> </ul>   |
| D5 | Determine filament dynamics dependence on separatrix and divertor condition ( $n_{e,sep}$ , collisionality, shearing, $\alpha_t$ , recycling state) and how it impacts the near and far SOL transport |    | Exploratory | <ul style="list-style-type: none"> <li>❖ None reported but we know work in progress both on AUG and TCV at least in H-mode.</li> </ul>  |

# RT16: PFC ageing under tokamak conditions

|    |   | 21 | Status                | Achievements  |
|----|---|----|-----------------------|---|
| D1 | Quantify using experimental data and predictive modelling local power load distributions at castellated and shaped PFCs for ITER and DEMO   | X  | Mature – underpinning | <ul style="list-style-type: none"> <li>❖ AUG : data from previous experiments on gap penetration conclusive, corresponding paper = work in progress</li> <li>❖ WEST : data analysis from previous campaigns ongoing, complex interpretation of IR data evidenced (emissivity, reflections, cavity effects in gaps); good basis for 2022 experiments</li> <li>❖ Modelling effort just started</li> </ul> |
| D2 | Determine the role of plasma parameters and thermionic emission in melt dynamics on metallic plasma-facing components in view of ITER operation   | X  | Mature - support      | <ul style="list-style-type: none"> <li>❖ AUG : data from previous melting experiments + Ir vs Nb experiment conclusive, modelling ongoing</li> <li>❖ WEST : update of the MEMOS code for actively cooled PFC performed, modelling of previous WEST sustained melting experiments ongoing</li> </ul>   |
| D3 | Assessment of thermo-mechanical degradation of ITER like actively cooled W PFCs (including pre-damaged PFC) in tokamak conditions by sustained high power / high particle fluence plasma exposure |    | Emerging              | <ul style="list-style-type: none"> <li>❖ Preparation of pre damaged PFU (pronounced crack network) performed, pre damaged PFU installed, ready for exposure in WEST for C6 campaign</li> <li>❖ Plans to produce a more severe pre-damage (self castellation) for C7</li> </ul>  |

# RT17: Material migration and fuel retention mechanisms in tokamaks

|    |   | 21 | Status                      | Achievements   |
|----|---|----|-----------------------------|--|
| D1 | Determine mutual strength of divertor and main chamber W sources during L and H-mode operations with varying ELM sizes in multiple machines | X  | Mature – needs underpinning | <ul style="list-style-type: none"> <li>❖ Comparison made at the divertor region between L- and H-mode plasmas: gross erosion higher during inter-ELM conditions by a factor of 10-100 while net erosion only amplified by a factor of 2-3</li> <li>❖ AUG and WEST indicate comparable net erosion rates in divertor</li> </ul> |
| D2 | Quantify material migration pathways in the SOL and in the confined plasma in L and H-mode plasmas in multiple machines                     |    | Judgemental                 | <ul style="list-style-type: none"> <li>❖ Modelling confirms strong role of electron temperature in erosion</li> <li>❖ Increasing surface roughness strongly suppresses net erosion, surface features should be characterized by inclination angle distribution, not by average mean roughness</li> </ul>                       |
| D3 | Document fuel retention and ammonia formation in long-pulse conditions  | X  | Emerging                    | <ul style="list-style-type: none"> <li>❖ Preliminary experiments on ammonia formation in WEST analyzed (paper)</li> </ul>  |
| D4 | Determine fuel-removal and conditioning efficiencies in metallic devices in conditions relevant for ITER PFPO and extrapolate to DEMO       |    | Exploratory                 | <ul style="list-style-type: none"> <li>❖ First ECWC experiments carried out in AUG</li> </ul>  |

# RT18: Alternative Divertor Configuration

|    |   | 21 | Status      | Achievements  |
|----|---|----|-------------|---|
| D1 | Characterize possible benefits of the snowflake configuration for X-point radiation stability and dissipated power  | X  | Exploratory | MAST-U: none planned<br>TCV: Mostly L-mode, H-mode lack of time; Benefits of baffled SF+: Effect of poloidal flux expansion and $L_{II}$ near X-point on potential of X-point radiator in H-mode started, issue vertical stability  |
| D2 | Quantify the effect of total flux expansion on detachment onset, radiative stability and SOL dissipative capability, comparing MAST-U and TCV through both experiment and modelling                               | X  | Judgemental | MAST-U: Scenario with Super-X plasma generated 700 kA, L mode, $\delta R_{sep} \sim 0$ mm, constant density, detachment at lower density in SX, investigation hampered by locked modes<br>TCV: L- and H-mode (few attempts, lack of time)<br>Interpret with existing and new modelling just started |
| D3 | Determination of detachment onset, radiated power fractions, and core compatibility in H-mode for the most promising ADCs and characterization of ELM activity in view of pedestal, heat flux and control in ADCs |    | Exploratory | MAST-U: SX no H-mode or seeding yet<br>TCV: SF- over SN, benefits of radiation blob between X-points on core compatibility, ELMy H-mode, ELM free H-mode on going   |

# WP TE Grant deliverables for 2021

|                                 |  |         | Status  |
|---------------------------------|--|---------|---|
| <b>TE.D.01</b><br><b>(M 01)</b> | Successful establishment of Type I ELMy H-mode scenario with dominant electron heating for the first safe operation of ITER.               | 12/2021 | Partial; experiments planned in TCV in 2021                                 |
| <b>TE.D.02</b><br><b>(M 05)</b> | The effect of total flux expansion and snowflake configurations in environments with intrinsic impurities on power dissipation quantified. | 12/2021 | Experiments nearly completed – only L-mode but not H-mode; modeling ongoing |

# WP TE Milestones 2021

| Sequential M ID | Related WBS ID      | Title  | Due Date | Status of achievement  |
|-----------------|---------------------|--|----------|--|
| M01             | RT01 / RT02         | Mission 1.1: Achieve and complete TE.D1.01   | 12/2021  | Partial; experiments planned in TCV in 2021  |
| M02             | RT12                | Mission 1.3: Proposals for achievement of steady state high $\beta$ controlled scenario assessed.                                    | 12/2021  | Progress on TCV and AUG power in MAST- U lacking, delay in completion on TCV (power) |
| M03             | RT13/RT14/RT15/RT18 | Mission 2.1: Quantify the effect of divertor pressure on detachment and plasma core performance through changes in divertor closure. | 12/2021  | expected to be completed; interpretative modelling on going                          |
| M05             | RT18/RT13/RT14      | Mission 2.3: Achieve and complete TE.D1.02   | 12/2021  | Experiments nearly completed – only L-mode but not H-mode; modeling ongoing          |

# Progress on Thrusts and TSVVs 1/2

| TSVV / Research topic No  | 1      | 2      | 3      | 4      | 5    | 6      | 7      | 8      | 9      | 10     | 11     | 12     | 13     | 14     | 15     | 16    | 17     | 18     |

# Progress on Thrusts and TSVVs 2/2

Member of the E-TASC Scientific Board: **Marco Wischmeier** (Emmanuel Joffrin)

| Thrust / TFL                           |                                     |
|--|-------------------------------------|
| Thrust 1 (1/3/4) – WPTE as facilitator | Nicola Vianello (Marco Wischmeier)  |
| Thrust 2 (5/6/7) – WPTE member         | Antti Hakkola (Emmanuelle Tsitrone) |
| Thrust 3 (8/9/10) – WPTE member        | Emmanuel Joffrin (Antti Hakola)     |
| Thrust 5 (2/11/14) – WPTE member       | Benoit Labit (Emmanuel Joffrin)     |

- All but Thrust 5 started
- Thrust as a space for facilitating TSVVs interactions as well as interactions with WPTE Research Topics
- Interaction with SCs to identify mid and long term needs ongoing
- Timely validation of code components wished → Interaction with PIs and SCs for mutual awareness & opportunity for mutual participation to progress meetings
- Attempt to identify and foster synergies between TSVVs for code development and code validation/benchmark against WP TE experimental data
- All activities started, no palpable result yet as all in process of lift-off

## From TE to PWIE

- Carry out experiments to expose marker samples/plasma-facing components to pre-selected plasma discharges/during experimental campaigns
- Production of a variety of background plasmas to take into account specific features of individual experiments on the basis of well-defined base cases prepared under PWIE
- Comparison of PFC evolution (high heat-flux and fluence exposures, erosion experiments) in HHF/linear devices/tokamaks: data from tokamaks
- Additional resources for interpretation of experimental results in areas where resources are scarce (e.g., experimental piggy-back dust studies on AUG)
- [ADC: TE executes experiments on TCV and MAST-U for physics basis including interpretative modelling](#)

## From PWIE to TE

- Post mortem data on erosion/deposition/surface modification profiles on exposed marker samples/plasma-facing components to be benchmarked against plasma conditions during the actual experiments/campaigns (IR, LP, spectroscopy etc. data)
- Background plasmas for well-defined base cases to be further used for “theme variations” under TE
- Reproduction of the obtained erosion/deposition/melting/surface modification patterns using numerical modelling for planning new experiments
- Comparison of PFC evolution (high heat-flux and fluence exposures, erosion experiments) in HHF/linear devices/tokamaks: data from HHF and linear devices
- [ADC: PWIE to use this information for ADC DEMO and DTT \(through WP DES\) modelling and feedback open questions for TE to investigate on devices](#)

# No formalized interaction with WP SA yet

- No meeting held with WPSA yet (Delay of JT-60SA).
- Known overlap:
  - **First plasma:** RT03 (breakdown + ramp-up) + RT04 (control of disruptions), RT17 (conditioning)
  - **First campaigns:** RT12 (advanced scenario) + RT10 & RT11 (fast particles) + RT02 (pedestal) + RT05 (run-aways) are topics of interaction between the WPs, RT17 (conditioning)
- more overlap expected in 2022 in view of integrated commissioning

# Interaction with WP PrIO

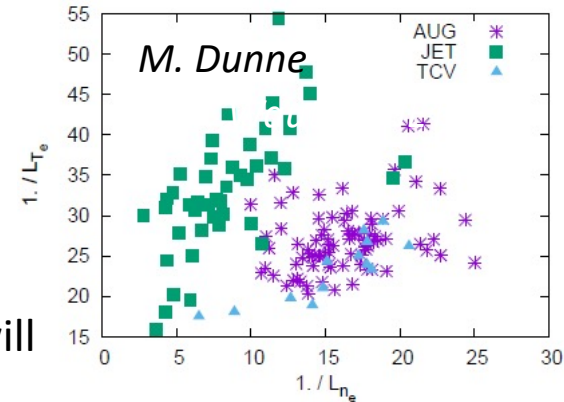

## Plasma start-up

- ❑ Through WP PrIO, TE (RT03) interacting with IO on IC and EC assisted breakdown, start-up together with TSVV11 and WPSA.
- ❑ Experiments and modelling activities regularly discussed in meetings organized by WP PrIO.

## EUROfusion database

- ❑ TE participates to the database activity as data provider in link with the experimental programme and the R.O.
- ❑ Pedestal, disruption and confinement databases logistics (IMAS, platform, etc ...) is managed by WP PrIO.

## ITPA

- ❑ TE is strongly involved in ITPA groups & participates to coordination of ITPA actions organized by WP PrIO and members will report in TF meetings.

## Regular meetings between FSD & DCT identified following items:

- Transient phases: set of 11 specific tasks on key physics or technical questions for strengthening the scenario development on DEMO; couple of TSVVs may play a role (TSVV7, TSVV11), tools mostly existing, experiments can be motivated in WP TE
- Exhaust and Re-attachment: List of open points identified (operational, basic physics, reduced model, off-baseline), list of activities for participation, topics for master/PhD students identified
- Small/no ELMs: key role of JET for certain aspects identified, categorization criteria identified and need to be applied
- No down selection at this stage desired by DCT
- Analysis how to proceed on prioritization of research areas underway
- Issue of resource prioritization and allocation for these activities – i.e. agreed to do, but none explicitly started as a result yet
- Comments: expecting tasks defined inside WPTE to contribute to DCT (ongoing how this is done, priorities for 2022 defined – schedule?)

# Key Gaps and Deficiencies

- Human resources for numerical interpretative modelling (e.g. Jorek, SOLPS-ITER,...) – competition with TSVVs
- Available resource for allocation to interpretative modelling
- At similar experimental and modelling support estimated budget for missions likely insufficient if COVID-19 restrictions lifted for traveling

# Back Up slides

# Risk Identification

| Risk description  | Mitigation action   |
|---|---|
| Non availability of any WP TE devices   | <i>Reprioritization of device usage</i>                                     |
| Delay in the PEX Upgrades on the various devices                                    | <i>Reprioritize PEX experiments and develop international collaboration</i> |
| SPI experiments not conclusive in mitigating the disruption loads on tokamaks.      | <i>Find alternative mitigation solution to be developed on tokamaks</i>     |
| Transferability of no/reduced ELM scenario to ITER and DEMO not feasible.           | <i>Increase focus on JT-60SA and the importance of stellarator research</i> |
| Monitoring of the retention in metallic devices not sufficiently quantifiable       | <i>Develop alternative monitoring methods</i>                               |
| JET DT campaign not or partially achieved in 2021                                   | <i>Review JET extension objectives for DTE3</i>                             |
| Delay on real time diagnostics deployment for radiation control                     | <i>Put more resources on real time control</i>                              |
| Fast ion losses found too high in high beta scenarios for viable fusion performance | <i>Expand the studies to JT-60SA</i>  |
