

Collisional-radiative model with molecular source for Eirene simulations

D. Borodin, [F. Cianfrani](#)

- Reference CRM model (poster at EPS)
- Discussion:
 - Molecular Spectroscopy
 - HYDKIN: data quality assessment

- Detachment control: crucial role of molecular gas injection.
- CRM models do not account for transport (0D).
 - 1D approximation: introduction of velocity to account for beams (STRAHL code, HYDKIN).
- Parametrization of transport through effective source term.

Ref CRM model

- Stationary Yacora run with:

Particle species

p, H, H₂⁺, H₂, **Z**

Reactions

molecular
dissociation

induced ionization

molecular ion
dissociation

H₂ source term

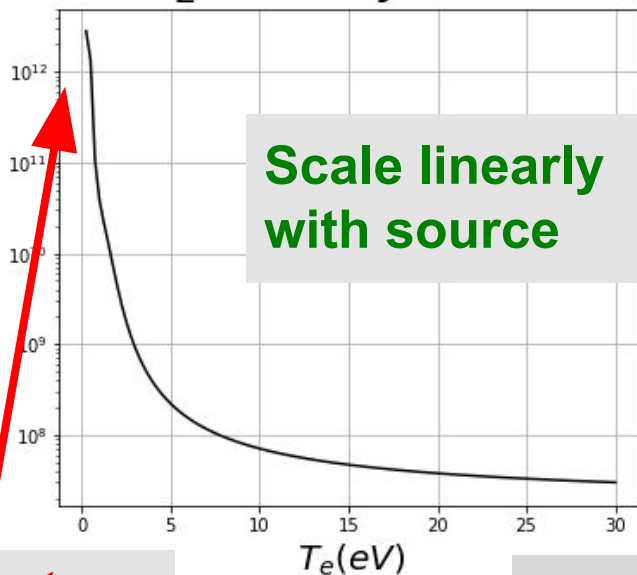

source = 10²¹ m⁻³s⁻¹

Ref CRM model

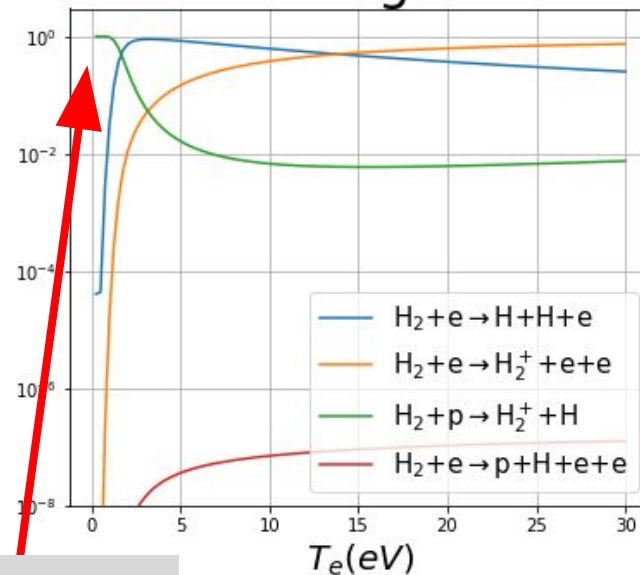

- Stationary Yacora run:

H₂ density (m⁻³)

Density peak at small temperature

Branching ratios

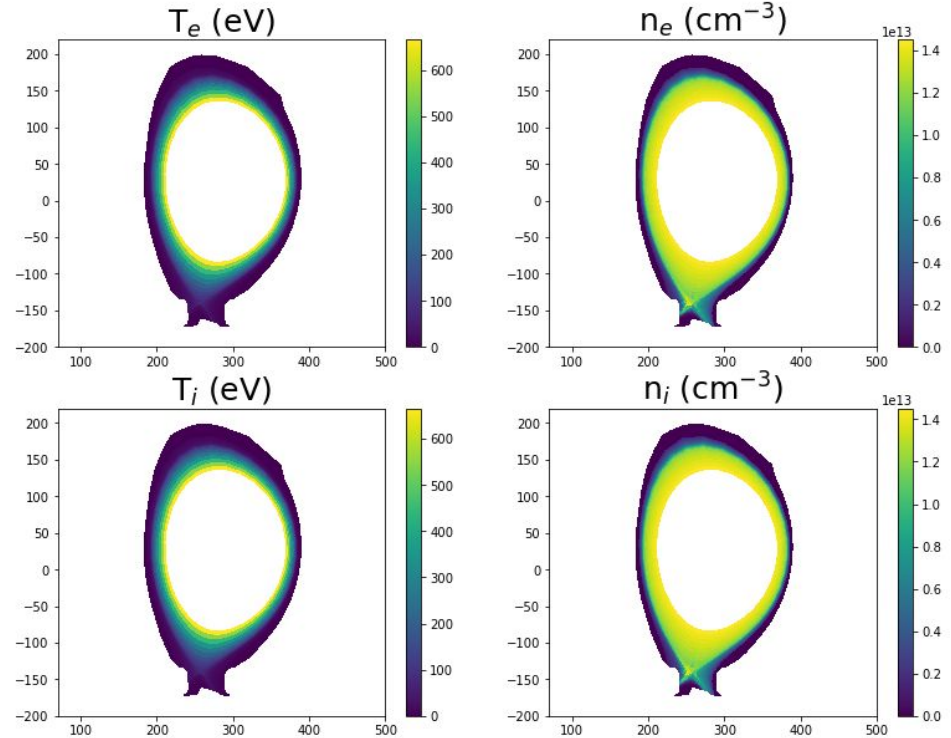

dissociation by proton impact

Ref CRM model: edge2d simulations

- 2D Eirene simulations for JET runs

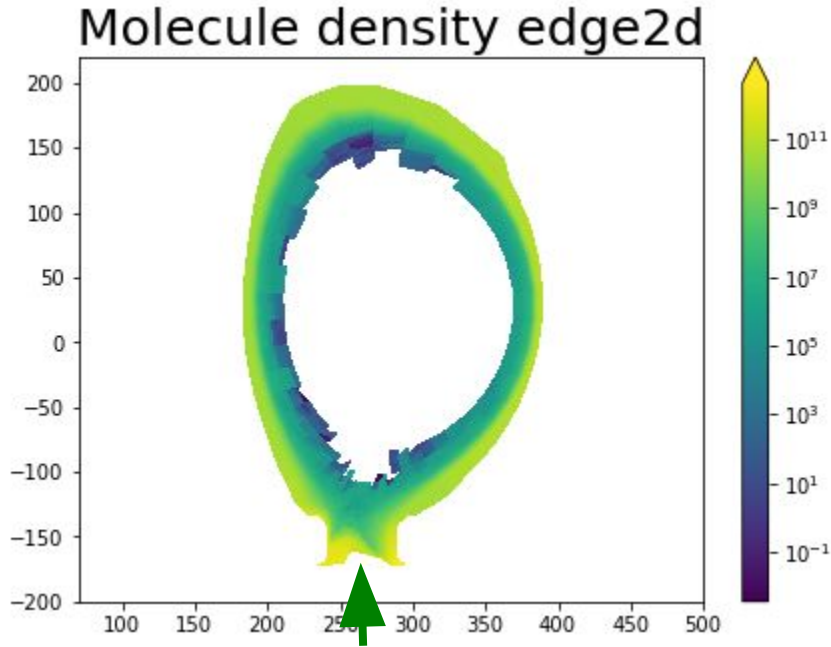

Particle species

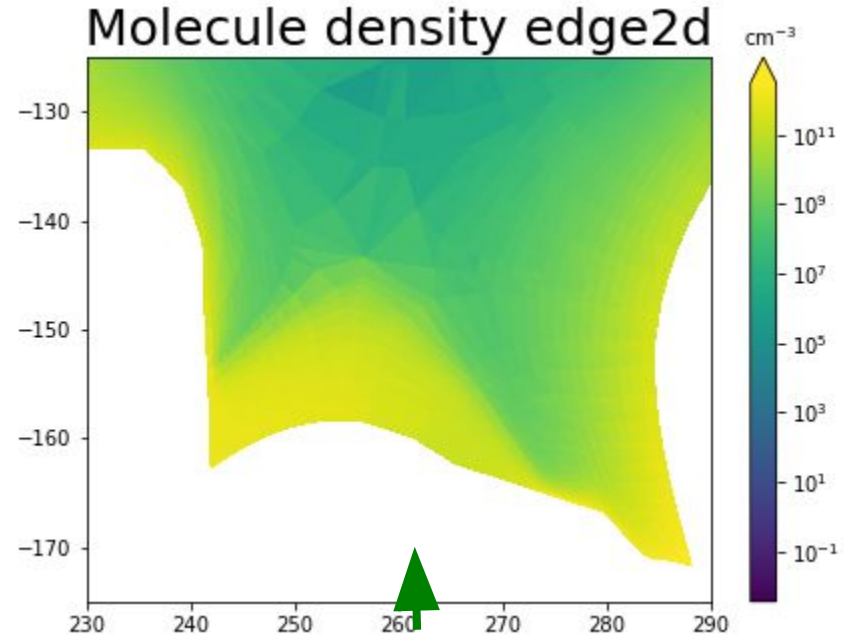

Ref CRM model: edge2d simulations

- 2D Eirene simulations for JET runs

Gas puffing

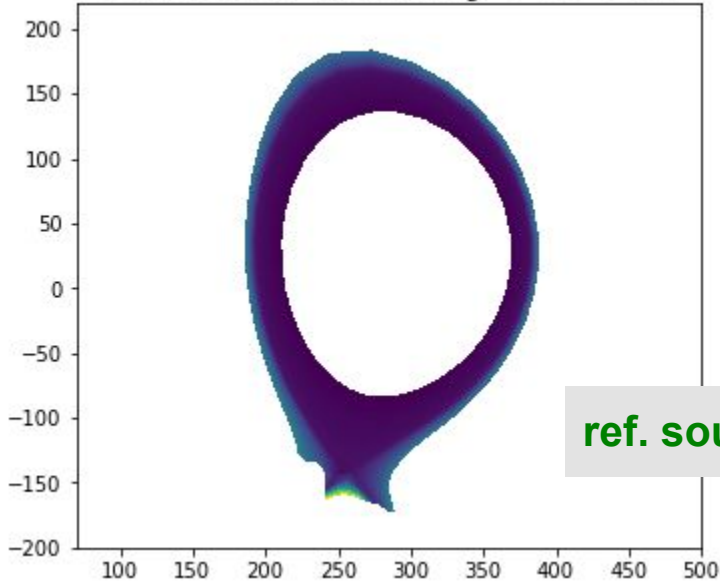

Gas puffing

Ref CRM model: edge2d simulations

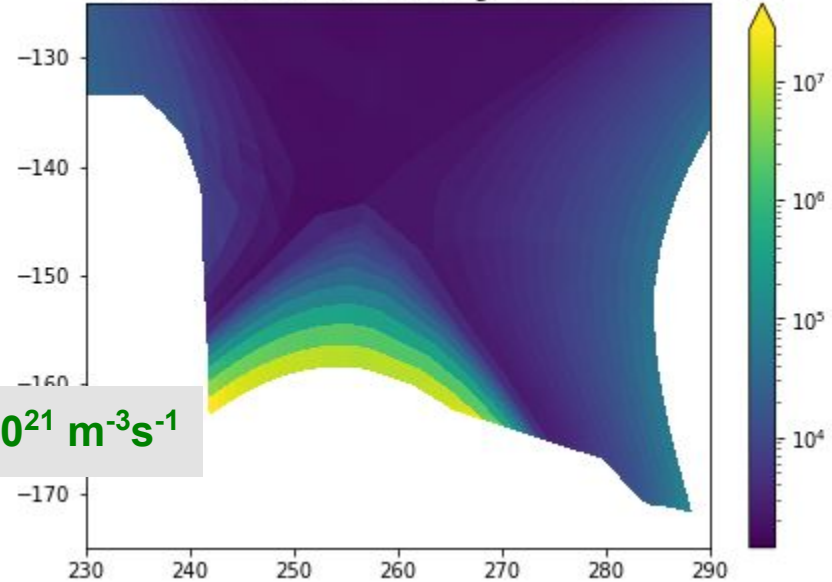

- Ref CRM model with plasma parameters from edge2d simulations:

Molecule density ref CRM

Molecule density ref CRM

ref. source = $10^{21} \text{ m}^{-3} \text{ s}^{-1}$

Ref CRM model: effective source

- Ratio of molecule density for edge2d and ref CRM:

$$\frac{\textit{density}(\textit{edge2D})}{\textit{density}(\textit{CRM})} = \frac{\textit{effective source}(\textit{edge2D})}{\textit{reference source}(\textit{CRM})}$$

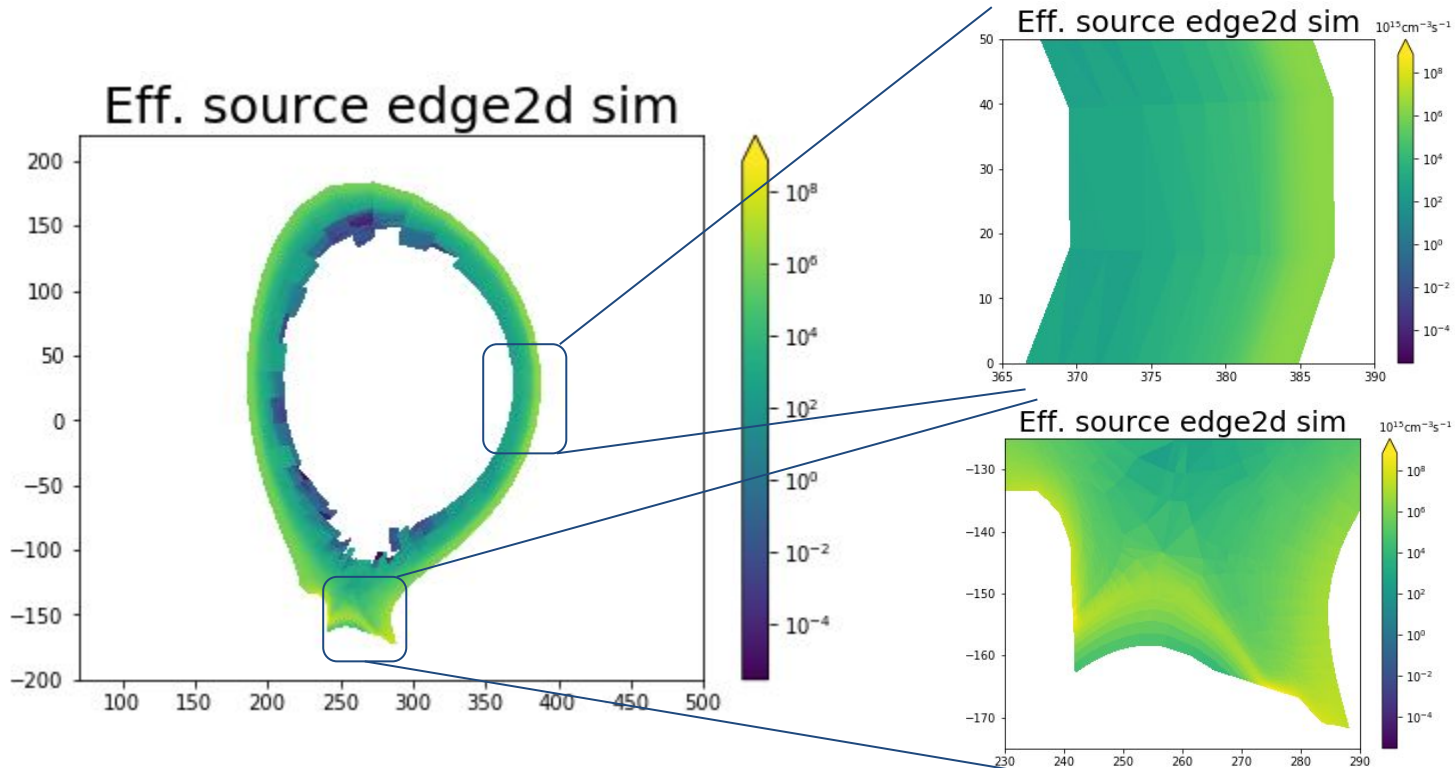

effective source(edge2D) :

- ❖ **does not depend on plasma parameters**
- ❖ **accounts for transport.**

Ref CRM model: effective source

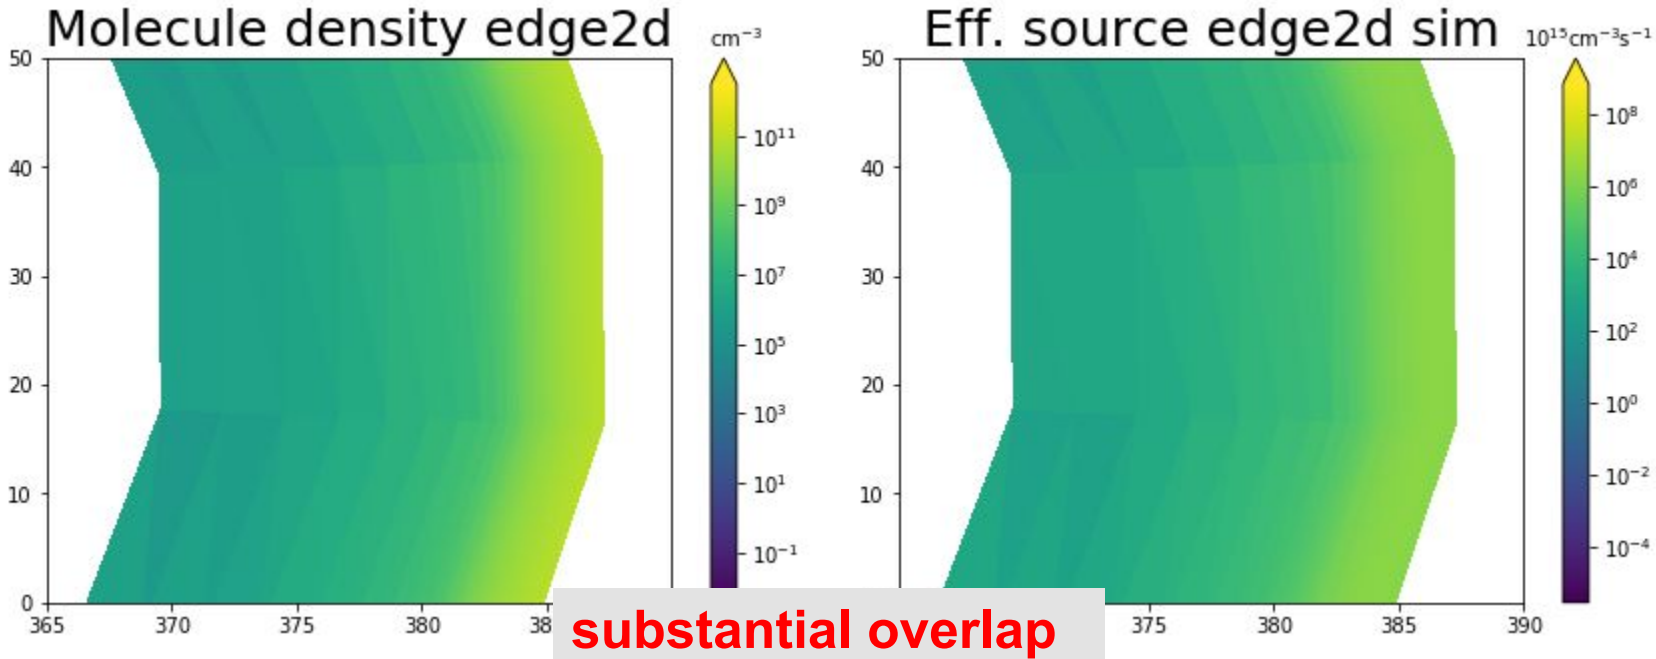

- Ratio of molecule density for edge2d and ref CRM:

Ref CRM model: effective source

- Density vs effective source (up-stream region):

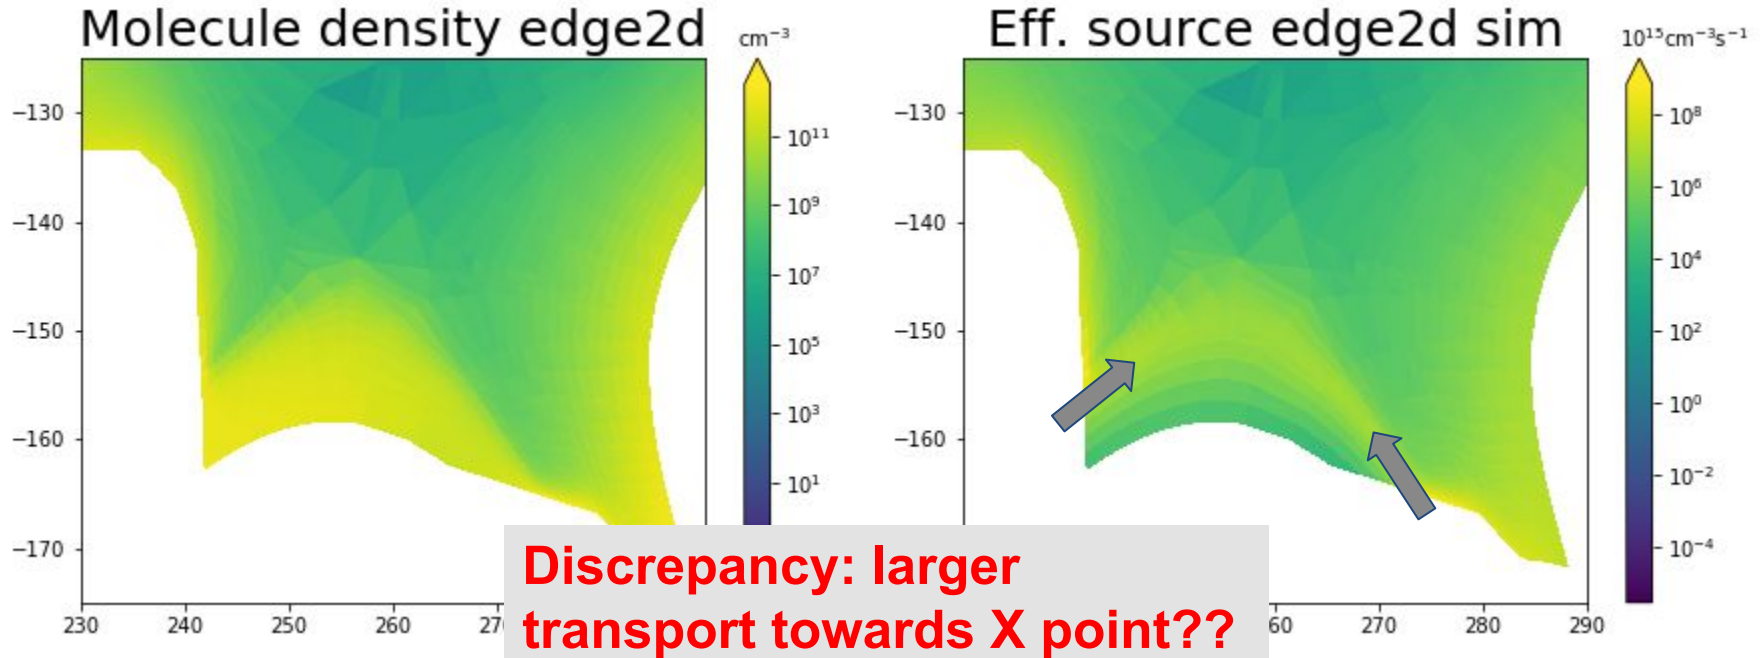

substantial overlap

Ref CRM model: effective source

- Density vs effective source (divertor region):

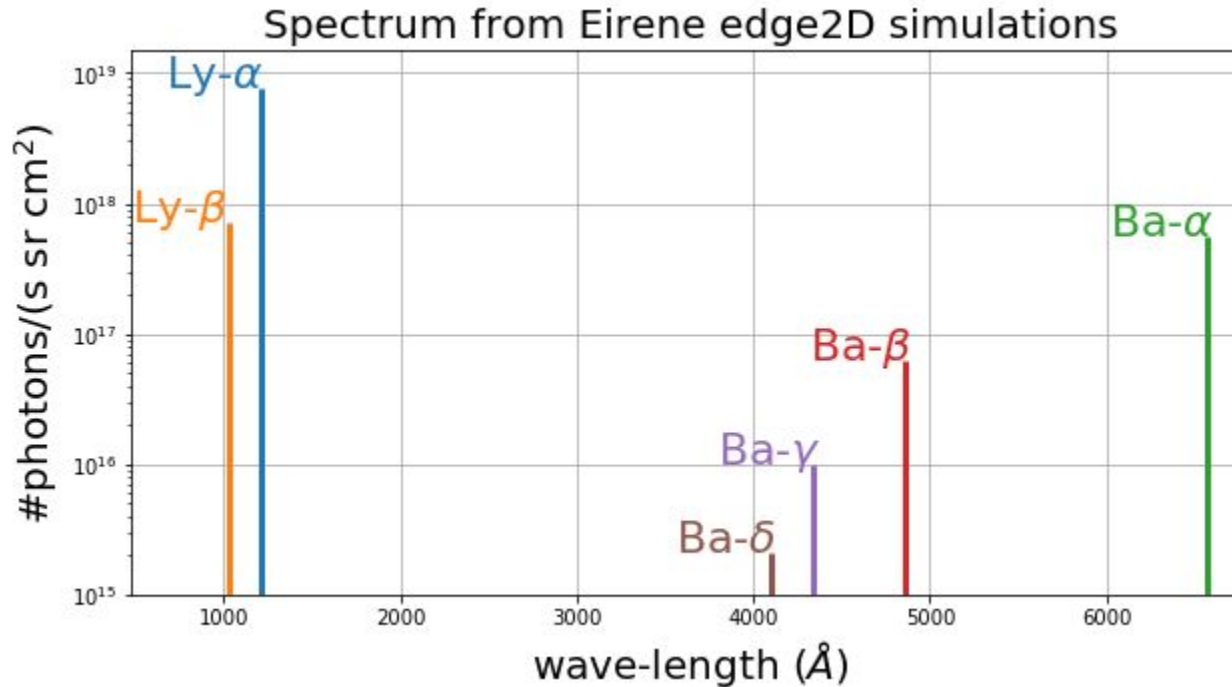

Looking for signals of molecular transitions from Eirene simulations:

- electronic transitions: Population of excited states from AMJUEL
(Reiter/Savada/Fujimoto)
 - ★ atomic transitions up to $n=6$ (Lyman, Balmer, Paschen ..)
 - ★ molecular transitions:
 - singlet $B, C \rightarrow X$ (Lyman, Werner)
 - triplet: $d \rightarrow a$ (Fulcher)

Molecular spectroscopy: Eirene

- Emissivity along a line of sight from the inner divertor (only atomic transitions)

Molecular spectroscopy: Eirene

- Emissivity along a line of sight from the inner divertor (molecule transitions):

overlap with
atomic trans

Triplet state
population??

Forschungszentrum Jülich GmbH
Institut für Plasmaphysik

HYDKIN

Reaction kinetics analysis online for
Hydrocarbon catabolism in hydrogen
plasmas

International Atomic Energy Agency
IAEA Atomic and Molecular Data Unit

Online reaction kinetics analysis, for chemistry in hydrogen plasmas.

- Data from different sources (AMJUEL, ADAS, H2VIBR, ...)
- Sources based on other sources (AMJUEL refers to Janev(1987), that refers to Takayanagi and Suzuki(1978), ...)
- How to assess the quality of data? Are we really using the best (and most recent) available data? Are there documented and accepted data quality tag and criteria?
 - use generations (“A” for ADAS, “L” for literature, ..)
 - use source

- Isotope effect in ion-atom collisions:
 - Landau-Zener: just a kinematical effect on relative velocity
 - Shift of ionization potentials.
 - Is there a proper rescaling??

Thanks for the attention!
