## Milestones, Deliverables for HYMAGYC

**Deliverable 2: Interpretive and predictive tools regarding NT stability in terms of MHD (e.g.,  $\beta$ - and current limits, both global and in the pedestal) and extended MHD (e.g., exploring kinetic and plasma compressibility effects).**

Milestone	Description	Participants	Target date
M2.2.1	Use HYMAGYC to investigate kinetic corrections to MHD	G. Fogaccia	12.2021
M2.2.2	Use HYMAGYC to investigate Alfvénic modes driven by energetic particles, with particular reference to DTT NT equilibria	G. Fogaccia	12.2023
M2.2.3	Use HYMAGYC to investigate the kinetic effects of energetic particles and core ions on the renormalized plasma inertia (compressibility) in scenarios of interest to plasmas close to ignition	G. Fogaccia	12.2025

Deliverable	Description	Participants	Target date
D2.2	Report on MHD stability properties of NT equilibria, including non-ideal effects in NT DTT equilibria and pedestal studies	A. Merle, G. Fogaccia	12.2023

**Deliverable 5: Predictive capability of the effect of shaping on fast ion confinement.**

Deliverable	Description	Participants	Target date
D5.2	Report on fast particle confinement and fast particle driven instabilities in NT	M. Vallar, G. Fogaccia	12.2023

## DTT new Positive and Negative Triangularity scenarios

The aim of our activity in 2023 is/will be to investigate the MHD stability, in particular the stability of Alfvénic modes driven by energetic particles, in DTT scenarios, with particular reference to the comparison between positive and negative triangularity equilibria.

Recently, a new DTT scenario has been developed, to allow an updated divertor configuration: this new, full power scenario, labelled v15, is a Single Null (SN), Positive Triangularity (PT) one with a cross section shifted upward by approx. 12-14 cm w.r.t. the previous scenarios, and results in an equilibrium with the magnetic axis above the equatorial plane. Among other consequences, this would result in Negative Neutral Beams which will not pass through the plasma center, and, thus, in Energetic Particle radial density profiles peaked off-axis.

## Positive Triangularity v15

$$R_{\text{axis}} = 2.2580\text{m}$$

$$Z_{\text{axis}} = 0.1897\text{m}$$

$$q_0 = 0.6124$$

$$q_{\text{edge}} = 4.3235$$

$$p_0 = 1.065\text{MPa}$$

$$I_p = 5.446\text{MA}$$

$$\text{Beta-axis} = 7.115\%$$

## Negative Triangularity flipped (fixed $p'$ , $I^*$ )

$$R_{\text{axis}} = 2.2931\text{m}$$

$$Z_{\text{axis}} = 0.2010\text{m}$$

$$q_0 = 0.6036$$

$$q_{\text{edge}} = 2.9984$$

$$p_0 = 1.093\text{MPa}$$

$$I_p = 5.531\text{MA}$$

$$\text{Beta-axis} = 7.261\%$$

## Negative Triangularity flipped (fixed $p'$ , constant- $q$ )

$$R_{\text{axis}} = 2.2985\text{m}$$

$$Z_{\text{axis}} = 0.2032\text{m}$$

$$q_0 = 0.6116$$

$$q_{\text{edge}} = 4.4115$$

$$p_0 = 0.940\text{MPa}$$

$$I_p = 4.217\text{MA}$$

$$\text{Beta-axis} = 6.427\%$$
