GBS simulations of TCV-X23

D. Mancini, P. Ricci

This work has been carried out within the framework of the EUROfusion Consortium, partially funded by the European Union via the Euratom Research and Trainling Programme (Grant Agreement No 101052200 — EUROfusion). The Swiss contribution to this work has been funded by the Swiss State Secretariat for Education, Research and Innovation (SER). Views and opinions expressed are however those of the author(s) only and do not necessarily reflect those of the European Union, the European Commission or SERI. Neither the European Union nor the European Commission nor SERI can be held responsible for them.

O Complex interplay of turbulence and detachment

- What is the role of molecular reactions in detachment and for turbulence?
- What is the estimate of radial to parallel flux in detachment conditions?

- Overview of GBS 5 species model
- Comparison of TCV-X21 and TCV-X23 simulations:
 - Average profiles of plasma and neutrals
 - Detachment characterization
 - First analysis of turbulence properties

Five species (D^+ , D_2^+ , e^- , D, D_2) and minimal interactions set **EPFL**

Detachment studied through simulations of tokamak plasma and neutrals, modelling:

- Ionization (atomic + MAI)
- Recombination (EIR + MAR)
- Charge exchange
- e-n collisions

Plasma model: drift-reduced Braginskii equations

Plasma described by Braginskii equations with neutrals interactions We evolve density, parallel velocity and temperatures of all charged species. Example:

$$\frac{\partial n_e}{\partial t} = -\nabla \cdot \left[n_e (\mathbf{b} v_{\parallel e} + \mathbf{v}_{E \times B} + \mathbf{v}_{de}) \right] + \int (I_{e,D} + I_{e,D_2}) d\mathbf{v}$$

$$I_{e,D} = n_D \langle v\sigma_{e,D}^{el} \rangle (n_e \Phi_{[\mathbf{v}_D, T_{e,D}^{el}]} - f_e) + n_D \langle v\sigma_{e,D}^{iz} \rangle (2n_e \Phi_{[\mathbf{v}_D, T_D^{iz}]} - f_e) - n_D + \langle v\sigma_{e,D^+}^{rec} \rangle f_e \rangle (2n_e \Phi_{[\mathbf{v}_D, T_D^{iz}]} - f_e) - n_D + \langle v\sigma_{e,D^+}^{rec} \rangle f_e \rangle (2n_e \Phi_{[\mathbf{v}_D, T_D^{iz}]} - f_e) - n_D + \langle v\sigma_{e,D^+}^{rec} \rangle f_e \rangle (2n_e \Phi_{[\mathbf{v}_D, T_D^{iz}]} - f_e) - n_D + \langle v\sigma_{e,D^+}^{rec} \rangle f_e \rangle (2n_e \Phi_{[\mathbf{v}_D, T_D^{iz}]} - f_e) - n_D + \langle v\sigma_{e,D^+}^{rec} \rangle f_e \rangle (2n_e \Phi_{[\mathbf{v}_D, T_D^{iz}]} - f_e) - n_D + \langle v\sigma_{e,D^+}^{rec} \rangle f_e \rangle (2n_e \Phi_{[\mathbf{v}_D, T_D^{iz}]} - f_e) - n_D + \langle v\sigma_{e,D^+}^{rec} \rangle f_e \rangle (2n_e \Phi_{[\mathbf{v}_D, T_D^{iz}]} - f_e) - n_D + \langle v\sigma_{e,D^+}^{rec} \rangle f_e \rangle (2n_e \Phi_{[\mathbf{v}_D, T_D^{iz}]} - f_e) - n_D + \langle v\sigma_{e,D^+}^{rec} \rangle f_e \rangle (2n_e \Phi_{[\mathbf{v}_D, T_D^{iz}]} - f_e) - n_D + \langle v\sigma_{e,D^+}^{rec} \rangle f_e \rangle (2n_e \Phi_{[\mathbf{v}_D, T_D^{iz}]} - f_e) - n_D + \langle v\sigma_{e,D^+}^{rec} \rangle f_e \rangle (2n_e \Phi_{[\mathbf{v}_D, T_D^{iz}]} - f_e) - n_D + \langle v\sigma_{e,D^+}^{rec} \rangle f_e \rangle (2n_e \Phi_{[\mathbf{v}_D, T_D^{iz}]} - f_e) - n_D + \langle v\sigma_{e,D^+}^{rec} \rangle f_e \rangle (2n_e \Phi_{[\mathbf{v}_D, T_D^{iz}]} - f_e) - n_D + \langle v\sigma_{e,D^+}^{rec} \rangle f_e \rangle (2n_e \Phi_{[\mathbf{v}_D, T_D^{iz}]} - f_e) - n_D + \langle v\sigma_{e,D^+}^{rec} \rangle f_e \rangle (2n_e \Phi_{[\mathbf{v}_D, T_D^{iz}]} - f_e) - n_D + \langle v\sigma_{e,D^+}^{rec} \rangle f_e \rangle (2n_e \Phi_{[\mathbf{v}_D, T_D^{iz}]} - f_e) - n_D + \langle v\sigma_{e,D^+}^{rec} \rangle f_e \rangle (2n_e \Phi_{[\mathbf{v}_D, T_D^{iz}]} - f_e) - n_D + \langle v\sigma_{e,D^+}^{rec} \rangle (2n_e \Phi_{[\mathbf{v}_D, T_D^{iz}]} - f_e) - n_D + \langle v\sigma_{e,D^+}^{rec} \rangle (2n_e \Phi_{[\mathbf{v}_D, T_D^{iz}]} - f_e) - n_D + \langle v\sigma_{e,D^+}^{rec} \rangle (2n_e \Phi_{[\mathbf{v}_D, T_D^{iz}]} - f_e) - n_D + \langle v\sigma_{e,D^+}^{rec} \rangle (2n_e \Phi_{[\mathbf{v}_D, T_D^{iz}]} - f_e) - n_D + \langle v\sigma_{e,D^+}^{rec} \rangle (2n_e \Phi_{[\mathbf{v}_D, T_D^{iz}]} - f_e) - n_D + \langle v\sigma_{e,D^+}^{rec} \rangle (2n_e \Phi_{[\mathbf{v}_D, T_D^{iz}]} - f_e) - n_D + \langle v\sigma_{e,D^+}^{rec} \rangle (2n_e \Phi_{[\mathbf{v}_D, T_D^{iz}]} - f_e) - n_D + \langle v\sigma_{e,D^+}^{rec} \rangle (2n_e \Phi_{[\mathbf{v}_D, T_D^{iz}]} - f_e) - n_D + \langle v\sigma_{e,D^+}^{rec} \rangle (2n_e \Phi_{[\mathbf{v}_D, T_D^{iz}]} - f_e) - n_D + \langle v\sigma_{e,D^+}^{rec} \rangle (2n_e \Phi_{[\mathbf{v}_D, T_D^{iz}]} - n_D + \langle v\sigma_{e,D^+} \rangle (2n_e \Phi_{[\mathbf{v}_D, T_D^{iz}]} - f_e) - n_$$

Where : $\Phi_{[\mathbf{v},T]}$ is a Maxwellian centered at velocity **v** , with temperature T , distribution of emitted electrons

With:

- quasi neutrality $n_{D^+} = n_e n_{D_2^+}$
- Zdhanov closure $\begin{bmatrix} q_{\parallel,\alpha} \\ R_{\parallel,\alpha} \end{bmatrix} = \sum_{\alpha} Z_{\alpha\beta} \begin{bmatrix} \nabla_{\parallel} T_{\beta} \\ v_{\parallel,\beta} v_{\parallel,CM} \end{bmatrix}$ with $n_{D_2^+} << n_{D^+}$
- Pre-sheath boundary conditions

[A. Coroado and P. Ricci 2022 Nucl. Fusion 62]

Kinetic neutral model - distribution functions evolved avoiding statistical noise of Monte Carlo methods

Boltzmann equation for f_D and f_{D_2}

 $\frac{\partial f_D}{\partial t} + \mathbf{v} \cdot \frac{\partial f_D}{\partial \mathbf{x}} = -n_e \langle v \sigma_{e,D}^{iz} \rangle f_D + n_e \langle v \sigma_{e,D^+}^{rec} \rangle f_{D^+} + \langle v \sigma_{D,D^+}^{cx} \rangle (n_D + f_D - n_D f_{D^+}) + \dots$

Boundary conditions reproduce:

- Neutral recycling due to ion flux to wall (including **parallel** and **drift velocity**)
- Reflection, re-emission, and association with probability from experimental measurements

Goal: detachment with longer leg and compare with X21

For each configuration:

- Half TCV size
- 2 simulations, low and high density (GP D_2)
- e⁻, D⁺ and D₂⁺ dynamics
 with D and D₂ interactions

Shape	B _t direction	Convergence	
TCV-X21	FF	Yes*	
TCV-X21	RF	Yes**	
TCV-X23	FF	Almost

EPFL

No changes in the OMP profile through puffing

Increased puff simulations show same density profile in low and high density TCV-X23:

- Density shoulder "between" the low and high density TCV-X21
- $\lambda_{\rm p}$ higher in TCV-X23

Ionization source detached from the target in X23

- Low temperature in TCV-X23 leads to ionization far from target even in low density
- Strong recombination in SOL for TCV-X23

Page 9

High D₂ density even with lower density

Higher D penetration due to higher D_2 dissociation

Page 10

High D₂ density even with lower density

Higher D penetration due to higher D₂ dissociation \rightarrow leads to momentum losses along leg

Decrease of particle flux localized along outer leg

Low density: mostly parallel flow, small gradient along leg

High density: increased flow upstream, but strong gradient along leg \rightarrow strong detachment

EPFL

At both target decrease with increasing density:

- At ISP same shape for TCV-X21 and TCV-X23 \rightarrow detached in similar way
- At OSP broader peak in TCV-X23 even at low density \rightarrow already quite detached

Low heat flux at both targets:

- At ISP, TCV-X23 exhibits heat flux similar to high density TCV-X21
- At OSP strong decrease of heat flux and complete flattening for high density

Positive fluctuations increase in high density

Ó

Slow or absent filaments when detached

EPFL

First analysis of turbulence profiles:

- At OMP velocity ~ follows ordering shoulder profiles
- At divertor no filaments close to separatrix in high density → disconnected?

Decreasing velocity below X-point, steeper if detached EPFL

Analysis along SOL:

- Radial velocity decreases strongly when detaching
- Poloidal velocity decreases rapidly with longer leg and higher density below X-Point

EPFL

GBS simulations to reproduce experimental results of TCV-X23 shots are almost converged

Preliminary analysis of comparison low vs high density in TCV-X23 shows:

- Similar profiles in the two cases (between TCV-X21 case) \rightarrow low impact of puffing at OMP
- Low plasma temperature in TCV-X23
- <u>Strong fluxes reduction with puffing</u> \rightarrow localized neutrals increase momentum losses
- Stronger detachment in TCV-X23 high density case (higher density with lower fluxes)
- Enhanced fluctuations level and OMP velocity for higher density
- No filaments in divertor region → disconnected filaments?

Next steps:

- Collect more turbulence statistics, verify disconnected filaments when detached
- Understand balance of neutrals along leg
